UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q37-Q42):

NEW QUESTION # 37

What is the output of the Process Analysis stage?

- A. Hypercare Support Plan
- **B. Process Definition Document (PDD)**
- C. Project Charter
- D. Solution Design Document

Answer: B

Explanation:

The primary output of the Process Analysis stage is the Process Definition Document (PDD). This document captures a detailed description of the As-Is process, including process steps, roles involved, input/output data, exception scenarios, and system interactions.

The Business Analyst and Solution Architect work closely with the Client Team to observe the current process and document it in a structured and comprehensive format. The PDD serves as the foundation for defining the scope, identifying automation opportunities,

and creating the future To-Be design.

A well-documented PDD ensures that the implementation team fully understands what is being automated and helps in developing accurate test cases for UAT and success criteria for deployment approval.

NEW QUESTION # 38

Which of the following best describes how automation software robots operate?

- A. They write code autonomously.
- **B. They mimic human actions to interact with digital systems and applications.**
- C. They require constant human supervision.
- D. They physically interact with machines to perform tasks.

Answer: B

Explanation:

Automation software robots, particularly those built using UiPath, operate by mimicking human actions to interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.

These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.

By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.

Software robots do not write code on their own—developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.

NEW QUESTION # 39

Which UiPath platform layer includes tools such as UiPath Studio and Document Understanding?

- A. Measure
- B. Orchestrate
- C. Discover
- **D. Automate**

Answer: D

Explanation:

The Automate layer of the UiPath Business Automation Platform includes tools such as UiPath Studio, UiPath Action Center, and UiPath Document Understanding. This layer is focused on building and deploying automation workflows that execute the desired processes.

* UiPath Studio is the development environment where automation workflows are built.

* Document Understanding allows robots to extract, interpret, and process data from structured and unstructured documents.

* Action Center enables human-in-the-loop automation by allowing manual intervention where needed.

The Automate layer brings the business logic to life by translating process requirements into executable robot actions. It's at the core of UiPath's capability to reduce manual effort and increase operational efficiency through software robots.

NEW QUESTION # 40

Which document is used to define how UAT will be conducted and by whom?

- **A. User Acceptance Testing (UAT) Plan**
- B. Access Control Matrix
- C. Project Charter
- D. Solution Design Document

Answer: A

Explanation:

The User Acceptance Testing (UAT) Plan is the document that defines how UAT will be conducted, who will participate, what test scenarios will be used, and what constitutes success.

This plan typically includes:

- * Roles and responsibilities during testing
- * UAT schedule and timelines
- * Test data and environment setup
- * Test cases and expected outcomes
- * Defect management and resolution protocol

The UAT Plan ensures a structured and coordinated approach to acceptance testing. It is typically prepared by the Business Analyst and Project Manager, and is reviewed by both the Implementation and Client Teams to ensure alignment before testing begins.

NEW QUESTION # 41

What is a key activity carried out during the User Acceptance Testing (UAT) stage?

- A. Testing the automation in a business-like environment by end users
- B. Developing reusable components
- C. Reviewing project SOW
- D. Conducting informal process shadowing

Answer: A

Explanation:

During the User Acceptance Testing (UAT) stage, the automation is tested in a business-like environment by end users to confirm that it meets the agreed-upon requirements and performs as expected under real-world conditions.

This phase is critical because it validates the automation's functionality, accuracy, reliability, and usability.

End users - usually from the Client Team - execute test cases defined earlier, often based on the Process Definition Document (PDD) and UAT Plan.

If any bugs or discrepancies are identified, they are reported and fixed by the Automation Developer. Only after successful completion of UAT is the automation approved for deployment into the production environment. This stage ensures stakeholder confidence and minimizes risk before go-live.
