

# New SAP-C02 Test Dumps & Hot SAP-C02 Spot Questions

2025 Latest Itcertmaster SAP-C02 PDF Dumps and SAP-C02 Exam Engine Free Share: <https://drive.google.com/open?id=1XiDBk8FxMy9BZv2eRYLGZx4jxayD9rL5>

You can be a part of this wonderful community. To do this you just need to pass the Amazon SAP-C02 certification exam. Are you ready to accept this challenge? Looking for the proven and easiest way to crack the Amazon SAP-C02 certification exam? If your answer is yes then you do not need to go anywhere. Just download Itcertmaster SAP-C02 exam practice questions and start AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) exam preparation without wasting further time. The Itcertmaster SAP-C02 Dumps will provide you with everything that you need to learn, prepare and pass the challenging Itcertmaster Amazon SAP-C02 exam with flying colors. You must try Itcertmaster SAP-C02 exam questions today.

Our company has employed a lot of excellent experts and professors in the field in the past years, in order to design the best and most suitable SAP-C02 study materials for all customers. More importantly, it is evident to all that the SAP-C02 Study Materials from our company have a high quality, and we can make sure that the quality of our products will be higher than other study materials in the market.

## Hot SAP-C02 Spot Questions & Interactive SAP-C02 Practice Exam

Our SAP-C02 study materials are the product for global users. No matter which country you are in, you can buy and study our SAP-C02 exam questions to pass the exam. And the standards in all aspects about our SAP-C02 learning engine are also required by international standards. In terms of privacy that everyone values, we respect every user. Our company has always put the customer first as a development concept. It is very safe and easy to buy our SAP-C02 Practice Brindumps!

## Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q403-Q408):

### NEW QUESTION # 403

A company is running an application in the AWS Cloud. The application collects and stores a large amount of unstructured data in

an Amazon S3 bucket. The S3 bucket contains several terabytes of data and uses the S3 Standard storage class. The data increases in size by several gigabytes every day.

The company needs to query and analyze the data

a. The company does not access data that is more than 1 year old. However, the company must retain all the data indefinitely for compliance reasons.

Which solution will meet these requirements MOST cost-effectively?

- A. Use Amazon Redshift Spectrum to query the data. Create an S3 Lifecycle policy to transition data that is more than 1 year old to S3 Glacier Deep Archive.
- B. Use an AWS Glue Data Catalog and Amazon Athena to query the data. Create an S3 Lifecycle policy to transition data that is more than 1 year old to S3 Glacier Deep Archive.
- C. Use S3 Select to query the data. Create an S3 Lifecycle policy to transition data that is more than 1 year old to S3 Glacier Deep Archive.
- D. Use Amazon Redshift Spectrum to query the data. Create an S3 Lifecycle policy to transition data that is more than 1 year old to S3 Intelligent-Tiering.

**Answer: A**

Explanation:

Generally, unstructured data should be converted structured data before querying them. AWS Glue can do that.

<https://docs.aws.amazon.com/glue/latest/dg/schema-relationalize.html> <https://docs.aws.amazon.com/athena/latest/ug/glue-athena.html>

#### NEW QUESTION # 404

A company is running an application in the AWS Cloud. The application consists of microservices that run on a fleet of Amazon EC2 instances in multiple Availability Zones behind an Application Load Balancer. The company recently added a new REST API that was implemented in Amazon API Gateway. Some of the older microservices that run on EC2 instances need to call this new API.

The company does not want the API to be accessible from the public internet and does not want proprietary data to traverse the public internet.

What should a solutions architect do to meet these requirements?

- A. Create an interface VPC endpoint for API Gateway, and set an endpoint policy to only allow access to the specific API. Add a resource policy to API Gateway to only allow access from the VPC endpoint. Change the API Gateway endpoint type to private.
- B. Modify the API Gateway to use IAM authentication. Update the IAM policy for the IAM role that is assigned to the EC2 instances to allow access to the API Gateway. Move the API Gateway into a new VPC, deploy a transit gateway and connect the VPCs.
- C. Create an AWS Site-to-Site VPN connection between the VPC and the API Gateway. Use API Gateway to generate a unique API Key for each microservice. Configure the API methods to require the key.
- D. Create an accelerator in AWS Global Accelerator, and connect the accelerator to the API Gateway. Update the route table for all VPC subnets with a route to the created Global Accelerator endpoint IP address. Add an API key for each service to use for authentication.

**Answer: A**

Explanation:

By implementing this solution, the company can ensure that the new API in API Gateway is not accessible from the public internet. The interface VPC endpoint provides private connectivity, allowing secure communication between the microservices running on EC2 instances and the API Gateway. This ensures the proprietary data does not traverse the public internet, enhancing security and data protection.

#### NEW QUESTION # 405

A company has 50 AWS accounts that are members of an organization in AWS Organizations.

Each account contains multiple VPCs. The company wants to use AWS Transit Gateway to establish connectivity between the VPCs in each member account.

Each time a new member account is created, the company wants to automate the process of creating a new VPC and a transit gateway attachment.

Which combination of steps will meet these requirements? (Choose two.)

- A. Launch an AWS CloudFormation stack set from the master account that automatically creates a new VPC and a peering transit gateway attachment in a member account.  
Share the attachment with the transit gateway in the master account by using a transit gateway service-linked role.
- B. From the master account, share the transit gateway with member accounts by using AWS Resource Access Manager.
- C. From the master account, share the transit gateway with member accounts by using AWS Service Catalog.
- D. Launch an AWS CloudFormation stack set from the master account that automatically creates a new VPC and a VPC transit gateway attachment in a member account.  
Associate the attachment with the transit gateway in the master account by using the transit gateway ID.
- E. From the master account, share the transit gateway with member accounts by using an AWS Organizations SCP.

**Answer: B,D**

Explanation:

#### NEW QUESTION # 406

A company has an application that runs on Amazon EC2 instances. A solutions architect is designing VPC infrastructure in an AWS Region where the application needs to access an Amazon Aurora DB cluster. The EC2 instances are all associated with the same security group. The DB cluster is associated with its own security group.

The solutions architect needs to add rules to the security groups to provide the application with least privilege access to the DB cluster.

Which combination of steps will meet these requirements? (Select TWO.)

- A. Add an outbound rule to the DB cluster's security group. Specify the EC2 instances' security group as the destination over the ephemeral ports.
- B. Add an outbound rule to the DB cluster's security group. Specify the EC2 instances' security group as the destination over the default Aurora port.
- C. Add an outbound rule to the EC2 instances' security group. Specify the DB cluster's security group as the destination over the default Aurora port.
- D. Add an inbound rule to the EC2 instances' security group. Specify the DB cluster's security group as the source over the default Aurora port.
- E. Add an inbound rule to the DB cluster's security group. Specify the EC2 instances' security group as the source over the default Aurora port.

**Answer: C,D**

Explanation:

Explanation

B: Add an outbound rule to the EC2 instances' security group. Specify the DB cluster's security group as the destination over the default Aurora port. This allows the instances to make outbound connections to the DB cluster on the default Aurora port. C: Add an inbound rule to the DB cluster's security group. Specify the EC2 instances' security group as the source over the default Aurora port. This allows connections to the DB cluster from the EC2 instances on the default Aurora port.

#### NEW QUESTION # 407

A company has a web application that securely uploads pictures and videos to an Amazon S3 bucket. The company requires that only authenticated users are allowed to post content. The application generates a presigned URL that is used to upload objects through a browser interface. Most users are reporting slow upload times for objects larger than 100 MB.

What can a Solutions Architect do to improve the performance of these uploads while ensuring only authenticated users are allowed to post content?

- A. Enable an S3 Transfer Acceleration endpoint on the S3 bucket. Use the endpoint when generating the presigned URL. Have the browser interface upload the objects to this URL using the S3 multipart upload API.
- B. Set up an Amazon API Gateway with a regional API endpoint that has a resource as an S3 service proxy. Configure the PUT method for this resource to expose the S3 PutObject operation. Secure the API Gateway using an AWS Lambda authorizer. Have the browser interface use API Gateway instead of the presigned URL to upload API objects.
- C. Configure an Amazon CloudFront distribution for the destination S3 bucket. Enable PUT and POST methods for the CloudFront cache behavior. Update the CloudFront origin to use an origin access identity (OAI). Give the OAI user s3:PutObject permissions in the bucket policy. Have the browser interface upload objects using the CloudFront distribution.
- D. Set up an Amazon API Gateway with an edge-optimized API endpoint that has a resource as an S3 service proxy.

Configure the PUT method for this resource to expose the S3 PutObject operation.  
Secure the API Gateway using a COGNITO\_USER\_POOLS authorizer. Have the browser interface use API Gateway instead of the presigned URL to upload objects.

**Answer: A**

Explanation:

Explanation: S3 Transfer Acceleration is a feature that enables fast, easy, and secure transfers of files over long distances between your client and an S3 bucket<sup>1</sup>. It works by leveraging the CloudFront edge network to route your requests to S3 over an optimized network path<sup>1</sup>. By using a Transfer Acceleration endpoint when generating a presigned URL, you can allow authenticated users to upload objects faster and more reliably<sup>2</sup>. Additionally, using the S3 multipart upload API can improve the performance of large object uploads by breaking them into smaller parts and uploading them in parallel<sup>3</sup>.

:

S3 Transfer Acceleration

Using Transfer Acceleration with presigned URLs

Uploading objects using multipart upload API

## NEW QUESTION # 408

.....

Our SAP-C02 exam materials will help you pass the exam with the least time. You can pass your exam after learning 48 to 72 hours of our SAP-C02 exam dumps. Since we have a professional team to edit and verify the exam materials, therefore the SAP-C02 exam materials are high-quality and accurate. Besides SAP-C02 Exam Dumps contain most of knowledge points of the exam, and you will have a good command of them in the process of learning. We are pass guarantee and money back guarantee. If you fail to pass the exam, we will refund your money.

**Hot SAP-C02 Spot Questions:** <https://www.itcertmaster.com/SAP-C02.html>
