AWS Certified Developer Associate Exam (DVA-C02) certification is recognized by many employers and can help developers advance their careers. According to the AWS website, individuals who hold the AWS-Developer certification earn an average salary of \$130,000 per year.

## Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q98-Q103):

### NEW QUESTION # 98

A multinational organization has applications deployed in three different AWS regions. These applications must securely communicate with each other by VPN. According to the organization's security team, the VPN must meet the following requirements:

AES 128-bit encryption

SHA-1 hashing

User access via SSL VPN

PFS using DH Group 2

Ability to maintain/rotate keys and passwords

Certificate-based authentication

Which solution should you recommend so that the organization meets the requirements?

- A. AWS hardware VPN between the virtual private gateway and customer gateway
- B. A third-party VPN solution deployed from AWS Marketplace
- C. A private MPLS solution from an international carrier
- D. AWS hardware VPN between the virtual private gateways in each region

**Answer: D**

### NEW QUESTION # 99

A developer is creating a microservices application that runs across multiple compute environments.

The application must securely access secrets that are stored in AWS Secrets Manager with minimal network latency. The developer wants a solution that reduces the number of direct calls to Secrets Manager and simplifies secrets management across environments. Which solution will meet these requirements with the LEAST operational overhead?

- A. Create a custom script that retrieves secrets directly from Secrets Manager and caches the secrets in a local database for each compute environment.
- B. Install the Secrets Manager Agent in each compute environment. Configure the agent to cache secrets locally. Securely retrieve the secrets from Secrets Manager as needed.
- C. Store the secrets in an Amazon S3 bucket. Retrieve and load the secrets as environment variables during application startup for each compute environment.
- D. Implement lazy loading logic in the application to fetch secrets directly from Secrets Manager and to cache the secrets in Redis.

**Answer: B**

Explanation:

The Secrets Manager Agent provides an out-of-the-box solution for securely caching secrets locally, reducing latency and operational overhead.

\* Why Option B is Correct:

\* Caching: The agent securely caches secrets locally, minimizing Secrets Manager API calls.

\* Security: Secrets remain secure during retrieval and storage.

\* Low Operational Overhead: Managed solution eliminates the need for custom logic.

\* Why Not Other Options:

\* Option A: Custom scripts introduce complexity and require ongoing maintenance.

\* Option C: Using Redis requires managing an additional service, increasing overhead.

\* Option D: Storing secrets in S3 lacks the fine-grained security controls of Secrets Manager.

### NEW QUESTION # 100

A Developer is asked to implement a caching layer in front of Amazon RDS. Cached content is expensive to regenerate in case of service failure. Which implementation below would work while maintaining maximum uptime?

- A. Implement Amazon ElastiCache Memcached.
- B. Install Redis on an Amazon EC2 instance.
- C. Migrate the database to Amazon Redshift.
- **D. Implement Amazon ElastiCache Redis in Cluster Mode**

**Answer: D**

### NEW QUESTION # 101

A company manages three separate AWS accounts for its production, development, and test environments. Each Developer is assigned a unique IAM user under the development account. A new application hosted on an Amazon EC2 instance in the development account requires read access to the archived documents stored in an Amazon S3 bucket in the production account.

How should access be granted?

- A. Create a temporary IAM user in the production account and provide read access to Amazon S3. Generate the temporary IAM user's access key and secret key and store these keys on the EC2 instance used by the application in the development account.
- **B. Create an IAM role in the production account and allow EC2 instance in the development account to assume that role using the trust policy. Provide read access for the required S3 bucket to this role.**
- C. Use a custom identity broker to allow Developer IAM users to temporarily access the S3 bucket.
- D. Create a temporary IAM user for the application to use in the production account.

**Answer: B**

### NEW QUESTION # 102

A company needs to ingest terabytes of data each hour from thousands of sources that are delivered almost continually throughout the day. The volume of messages generated varies over the course of the day. Messages must be delivered in real time for fraud detection and live operational dashboards.

Which approach will meet these requirements?

- A. Use the Amazon S3 API to write messages to an S3 bucket, then process the messages by using Amazon Redshift
- **B. Use Amazon Kinesis Data Streams with Kinesis Client Library to ingest and deliver messages**
- C. Send the messages to an Amazon SQS queue, then process the messages by using a fleet of Amazon EC2 instances
- D. Use AWS Data Pipeline to automate the movement and transformation of data

**Answer: B**
