NEW QUESTION # 170

There are two cross-site multi-active DR modes: replication multi-active and cross-site EC. Both modes support multi-site active-active. The difference is that in replication multi-active mode, each site has one data copy. However, cross-site EC distributes a piece of data to multiple sites and there is only one data copy among the sites.

- A. TRUE
- B. FALSE

Answer: A

Explanation:

Replication multi-active mode keeps one complete data copy at each site, enabling multiple active sites with full data redundancy. In contrast, cross-site EC (Erasure Coding) splits data across multiple sites so that only one distributed data copy exists among the sites, reducing storage overhead while still providing data resilience.
