最新的 Google Cloud Certified Professional-Data-Engineer 免費考試真題 (Q21-Q26):

問題 #21
You are migrating your data warehouse to BigQuery. You have migrated all of your data into tables in a dataset. Multiple users from your organization will be using the data. They should only see certain tables based on their team membership. How should you set user permissions?

- A. Create authorized views for each team in datasets created for each team. Assign the authorized views data viewer access to the dataset in which the data resides. Assign the users/groups data viewer access to the datasets in which the authorized views reside
- B. Assign the users/groups data viewer access at the table level for each table
- C. Create SQL views for each team in the same dataset in which the data resides, and assign the users /groups data viewer access to the SQL views
- D. Create authorized views for each team in the same dataset in which the data resides, and assign the users /groups data viewer access to the authorized views

答案：B

問題 #22
What is the general recommendation when designing your row keys for a Cloud Bigtable schema?

- A. Keep your row key reasonably short
- B. Keep your row key as long as the field permits
- C. Include multiple time series values within the row key
- D. Keep the row keep as an 8 bit integer

答案：A

解題說明：
A general guide is to, keep your row keys reasonably short. Long row keys take up additional memory and storage and increase the time it takes to get responses from the Cloud Bigtable server.

問題 #23
You designed a database for patient records as a pilot project to cover a few hundred patients in three clinics.
Your design used a single database table to represent all patients and their visits, and you used self-joins to generate reports. The server resource utilization was at 50%. Since then, the scope of the project has expanded. The database must now store 100 times more patient records. You can no longer run the reports, because they either take too long or they encounter errors with insufficient compute resources. How should you adjust the database design?

- A. Partition the table into smaller tables, with one for each clinic. Run queries against the smaller table pairs, and use unions for consolidated reports.
- B. Normalize the master patient-record table into the patient table and the visits table, and create other necessary tables to avoid self-join.
- C. Add capacity (memory and disk space) to the database server by the order of 200.
- D. Shard the tables into smaller ones based on date ranges, and only generate reports with prespecified date ranges.

答案：B

問題 #24
Which of the following is NOT a valid use case to select HDD (hard disk drives) as the storage for Google Cloud Bigtable?

- A. You will not use the data to back a user-facing or latency-sensitive application.
- B. You need to integrate with Google BigQuery.
- C. You expect to store at least 10 TB of data.
- D. You will mostly run batch workloads with scans and writes, rather than frequently executing random reads of a small number of rows.

答案：B

解題說明：
For example, if you plan to store extensive historical data for a large number of remote-sensing devices and then use the data to generate daily reports, the cost savings for HDD storage may justify the performance tradeoff. On the other hand, if you plan to use the data to display a real-time dashboard, it probably would not make sense to use HDD storage-reads would be much more frequent in this case, and reads are much slower with HDD storage.

問題 #25
You operate a database that stores stock trades and an application that retrieves average stock price for a given company over an adjustable window of time. The data is stored in Cloud Bigtable where the datetime of the stock trade is the beginning of the row key. Your application has thousands of concurrent users, and you notice that performance is starting to degrade as more stocks are added. What should you do to improve the performance of your application?

- A. Change the row key syntax in your Cloud Bigtable table to begin with a random number per second.
- B. Use Cloud Dataflow to write summary of each day's stock trades to an Avro file on Cloud Storage. Update your application to read from Cloud Storage and Cloud Bigtable to compute the responses.
- C. Change the data pipeline to use BigQuery for storing stock trades, and update your application.
- D. Change the row key syntax in your Cloud Bigtable table to begin with the stock symbol.

答案：D
