WGU Cloud Deployment and Operations Sample Questions (Q43-Q48):

NEW QUESTION # 43
(Which AWS monitoring feature is used to process events using AWS Lambda?)

- A. Logs
- B. Metrics
- C. Rules
- D. Targets

Answer: C

Explanation:
The AWS monitoring feature used to process events with AWS Lambda is CloudWatch Events, specifically through the use of rules. Rules define the events to monitor (e.g., based on event patterns) and specify targets like AWS Lambda functions to process those events. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, CloudWatch Events) explains that rules are the core component for event-driven architectures, enabling automation by linking events to Lambda for processing. Metrics, targets,

and logs are related but not the primary feature for this function.

NEW QUESTION # 44
(A company is using the CloudWatch agent on its EC2 Linux instances. The company needs to determine how long read requests have waited on the instance's I/O for proper sizing of the instance. Which metric should the company use?)

- A. diskio_reads
- B. diskio_read_bytes
- C. disk_read_ops
- D. disk_io_time

Answer: D

Explanation:
The `disk_io_time` metric, collected by the CloudWatch agent on EC2 Linux instances, measures the total time (in milliseconds) that read and write requests have waited on I/O, helping to assess disk performance for instance sizing. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Agent Metrics) states, "The `disk_io_time` metric, available via the CloudWatch agent, tracks the time spent waiting for I/O operations, providing insight into disk contention for optimizing EC2 instance sizing." disk_read_ops, diskio_reads, and diskio_read_bytes measure operation counts or bytes, not wait times.

NEW QUESTION # 45
(An endpoint is not responding to a request based on the failure threshold provided. What does Route 53 do once it considers the endpoint unhealthy?)

- A. Enables SQS
- B. Terminates the connection attempt
- C. Notifies CloudWatch
- D. Sends out an SNS notification

Answer: B

Explanation:
When Amazon Route 53 determines an endpoint is unhealthy based on a failure threshold (e.g., via health checks), it terminates the connection attempt to that endpoint and routes traffic to a healthy alternative, if available. This behavior ensures high availability using routing policies like failover or latency-based routing.
The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Health Checks) states,
"Route 53 stops routing traffic to an unhealthy endpoint by terminating connection attempts once the health check failure threshold is exceeded, redirecting to a healthy resource." Options A, C, and D are not direct actions taken by Route 53 in this scenario.

NEW QUESTION # 46
(Which two solutions are supported by CloudWatch? Choose 2 answers.)

- A. Threat detection
- B. Load balancing
- C. Instance monitoring
- D. Event response

Answer: C,D

Explanation:
Amazon CloudWatch supports several monitoring and management solutions, including event response and instance monitoring. Event response is facilitated through CloudWatch Events, which can trigger actions based on predefined rules, such as invoking AWS Lambda functions. Instance monitoring involves collecting and tracking metrics from Amazon EC2 instances, providing visibility into performance and health. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Overview) highlights that CloudWatch is designed for instance monitoring and event-driven responses, while load balancing and threat detection are handled by services like Elastic Load Balancing and GuardDuty, respectively.

NEW QUESTION # 47
(What needs to be configured in Systems Manager to run Automation documents on schedule?)

- A. Maintenance window
- B. Session preferences
- C. Resource groups
- D. Rate control

Answer: A

Explanation:
To run Automation documents on a schedule in AWS Systems Manager, a maintenance window must be configured. Maintenance windows define the time periods during which automated tasks, including the execution of Automation documents, can run. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Maintenance Windows) explains that maintenance windows are used to schedule and control the execution of Systems Manager tasks, ensuring they align with operational windows. Rate control, session preferences, and resource groups are not used for scheduling automation tasks.
