Palo Alto Networks Cybersecurity Practitioner Cybersecurity-Practitioner Prüfungsfragen mit Lösungen (Q79-Q84):

79. Frage

Which of these ports is normally associated with HTTPS?

- A. 0
- **B. 1**
- C. 2
- D. 3

Antwort: B

Begründung:

HTTPS is a protocol that encrypts and secures the communication between web browsers and servers. HTTPS uses SSL or TLS certificates to establish a secure connection and prevent unauthorized access or tampering of data. HTTPS typically uses port 443, which is the default port for HTTPS connections. Port 443 is different from port 80, which is the default port for HTTP connections. HTTP is an unencrypted and insecure protocol that can expose sensitive information or allow malicious attacks. Port 443 is also different from port 5050, which is a common port for some applications or services, such as Yahoo Messenger or SIP. Port 5050 is not associated with HTTPS and does not provide any encryption or security. Port 443 is also different from port 25, which is the default port for SMTP, the protocol used for sending and receiving emails. Port 25 is not associated with HTTPS and does not encrypt the email content or headers. Reference:

* Can I use another port other than 443 for HTTPS/SSL communication?

80. Frage

Which two services does a managed detection and response (MDR) solution provide? (Choose two.)

- **A. Incident impact analysis**
- B. Periodic firewall updates
- **C. Proactive threat hunting**
- D. Improved application development

Antwort: A,C

Begründung:

Managed Detection and Response (MDR) services combine incident impact analysis and proactive threat hunting to enhance organizational security posture. Incident impact analysis assesses the severity, scope, and potential damage of identified threats, helping prioritize responses. Proactive threat hunting involves skilled analysts searching for hidden threats that automated detection

may miss, leveraging threat intelligence and behavioral analytics. Palo Alto Networks' MDR integrates Cortex XDR and human expertise to detect, investigate, and remediate sophisticated threats early. Unlike routine firewall updates or development processes, MDR is focused on active threat discovery and comprehensive incident management.

81. Frage

What is the purpose of host-based architectures?

- A. They divide responsibilities among clients.
- B. They allow client computers to perform most of the work.
- C. They share the work of both clients and servers.
- **D. They allow a server to perform all of the work virtually.**

Antwort: D

Begründung:

In a host-based architecture, the server (host) handles all processing tasks, while the client mainly provides input/output. This centralizes control, processing, and data storage on the server, reducing the client's role to that of a terminal.

82. Frage

Which of the following is an AWS serverless service?

- A. Kappa
- B. Delta
- C. Beta
- **D. Lambda**

Antwort: D

Begründung:

Examples of serverless environments include Amazon Lambda and Azure Functions. Many PaaS offerings, such as Pivotal Cloud Foundry, also are effectively serverless even if they have not historically been marketed as such. Although serverless may appear to lack the container-specific, cloud native attribute, containers are extensively used in the underlying implementations, even if those implementations are not exposed to end users directly.

83. Frage

Based on how much is managed by the vendor, where can CaaS be situated in the spread of cloud computing services?

- A. between FaaS and Serverless
- B. between PaaS and FaaS
- **C. between IaaS and PaaS**
- D. between On-Prem and IaaS

Antwort: C

Begründung:

CaaS, or Containers-as-a-Service, is a cloud service that allows users to manage and deploy applications using containers and clusters. CaaS can be situated between IaaS and PaaS in the spread of cloud computing services, based on how much is managed by the vendor. IaaS, or Infrastructure-as-a-Service, provides the lowest level of abstraction, where users have to manage the servers, storage, network, and operating system. PaaS, or Platform-as-a-Service, provides a higher level of abstraction, where users only have to manage the application code and data. FaaS, or Function-as-a-Service, provides the highest level of abstraction, where users only have to manage the functions or logic of the application. CaaS falls in between IaaS and PaaS, as it provides users with more control over the container orchestration and configuration than PaaS, but also simplifies the infrastructure management and scaling than IaaS¹²³.
