WGU Practical Applications of Prompt QFO1 Sample Questions (Q32-Q37):

NEW QUESTION # 32

Which factor should be considered when writing generative AI prompts?

- A. Time of day
- **B. Scope**
- C. Uniqueness
- D. Location

Answer: B

Explanation:

When engineering a prompt, determining the "Scope" is vital for achieving a high-quality response. Scope refers to the boundaries and breadth of the request. A prompt with a scope that is too broad (e.g., "Tell me everything about history") will result in a superficial, overly generalized, and likely unhelpful response.

Conversely, a prompt with a scope that is too narrow might exclude necessary context.

Effective prompt engineering involves "right-sizing" the scope to match the user's specific needs. This includes defining the timeframe, the specific sub-topics to be covered, and the level of detail required. By managing the scope, the user prevents the AI from "hallucinating" or filling in gaps with irrelevant information. It also helps manage the model's token limit and ensures that the most important information is prioritized in the output. While factors like uniqueness or location might be relevant in very specific niche cases, "Scope" is a universal pillar of prompt construction. It ensures that the AI stays focused on the task at hand, delivering a concentrated and accurate response that fits within the user's practical requirements.

NEW QUESTION # 33

A person is using generative AI to create a social media post. Why is it important to write an effective prompt?

- A. The prompt ensures that the post will be well received.
- B. The prompt ensures that the content is original.
- C. The prompt indicates how to customize the post for each reader.
- **D. The prompt prevents output that is nonsensical.**

Answer: D

Explanation:

Writing an effective prompt is essential because it provides the logical framework the AI needs to process a request; primarily, the prompt prevents output that is nonsensical. Generative AI models are statistical engines that predict the next most likely word or character. Without a clear, well-structured prompt that includes instructions and context, the model can easily lose the "thread" of logic, leading to "hallucinations" or sequences of text that are grammatically correct but logically incoherent or irrelevant to the user's goal.

In the context of social media, where brevity and impact are key, an ineffective prompt might result in a post that uses the wrong hashtags, misses the brand voice, or includes bizarre metaphors that don't make sense to the audience. While no prompt can "ensure" a post will be well-received by humans (Option B) or guarantee absolute originality (Option D), a structured prompt guides the AI to stay within the bounds of human logic.

By providing specific constraints (e.g., "Write a 20-word caption about coffee in a joyful tone"), the user ensures the output is a sensible, usable piece of content rather than a random string of related words.

NEW QUESTION # 34

A user wants to automatically identify and provide the name of the person speaking on a conference call. Which advanced AI tool fits this goal?

- A. Speech recognition
- B. Object recognition
- **C. Voice recognition**
- D. Text recognition

Answer: C

Explanation:

The specific task of identifying who is speaking is the primary function of voice recognition (also known as speaker recognition or speaker identification). It is important to distinguish this from "Speech recognition." While speech recognition focuses on what is being said (converting spoken words to text), voice recognition focuses on the unique biometric characteristics of an individual's voice—such as pitch, cadence, and tone—to identify the specific person talking.

In a conference call setting, the AI compares the incoming audio stream against a database of stored "voiceprints." When a match is found, the system can display the name of the participant currently speaking.

This technology is a cornerstone of modern collaborative tools and security systems. In practical prompt engineering and AI integration, choosing the right "medium" or tool is vital; if a developer mistakenly uses a standard speech-to-text model, they would get a transcript of the meeting but would lose the metadata regarding speaker identity. Voice recognition adds a layer of "identity context" to the data, making it invaluable for automated meeting minutes, forensic analysis, and personalized user experiences in multi-user environments.

NEW QUESTION # 35

A person wants to use AI to digitize receipts for expense tracking. Which advanced AI tool should be used?

- A. Virtual personal assistant
- **B. Optical character recognition**
- C. Speech synthesis
- D. Voice recognition

Answer: B

Explanation:

To digitize physical documents like receipts, the necessary technology is Optical Character Recognition (OCR). OCR is a specialized AI field that involves the conversion of images of typed, handwritten, or printed text into machine-encoded text. When you take a photo of a receipt, the AI analyzes the pixels to identify the shapes of letters and numbers, then translates those shapes into digital characters that can be stored in a database or an Excel spreadsheet.

In the context of expense tracking, advanced OCR does more than just "read" the text; it uses "intelligent character recognition" to understand the layout. It can identify which number is the "Total," which is the "Tax," and which is the "Date" by looking at their positions on the page and the keywords nearby. This makes OCR an essential bridge between the physical and digital worlds. While a "Virtual personal assistant" (Option B) might use an OCR tool to help you, the specific technology doing the work of digitization is OCR. It saves hours of manual data entry and reduces the human error associated with typing in long strings of financial data, making it a powerful "practical application" of AI in business and personal finance.

NEW QUESTION # 36

What is an example of a prompt that has an appropriate level of specificity?

- A. "Tell me the best classes to take when attending a university."
- B. "Tell me about physics, chemistry, biology, and astronomy."
- **C. "Provide an overview of state representative election laws in Iowa."**
- D. "Explain how guidelines and regulations are established for businesses."

Answer: C

Explanation:

Specificity is the cornerstone of effective prompt engineering. A specific prompt provides clear boundaries and a narrow focus, which prevents the AI from generating generic or overwhelming amounts of irrelevant information. Option C, "Provide an overview of state representative election laws in Iowa," is the best example because it defines three critical parameters: the Subject (election laws), the Scope (state representative level), and the Location/Jurisdiction (Iowa).

In contrast, options A and D are far too broad; asking for an overview of four major sciences or all business regulations would result

in a superficial summary that lacks depth. Option B is subjective and lacks context, as "best classes" depends entirely on the student's major and career goals. By specifying the state and the specific legislative body, the user in Option C allows the AI to access a targeted subset of its training data. In practical applications, this level of specificity significantly reduces the risk of "hallucinations" or factual errors, as the model is guided to a precise factual domain. This is essential in professional research where accuracy and relevance are prioritized over general knowledge.
