Drupal-Site-Builder PrüfungGuide, Acquia Drupal-Site-Builder Zertifikat - Acquia Certified Drupal Site Builder Exam for Drupal 10, 11

Viele IT-Leute sind sich einig, dass Acquia Drupal-Site-Builder Zertifikat ein Sprungbrett zu dem Höhepunkt der IT-Branche ist. Deshalb kümmern sich viele IT-Experten um die Acquia Drupal-Site-Builder Zertifizierungsprüfung.

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Drupal-Site-Builder Prüfungsfragen mit Lösungen (Q10-Q15):

10. Frage

Your site has three Content types with a Media reference field. The field is configured to Media type as Image. You noticed that some users are adding animated GIF files while adding the content, which are very distracting. How can you disallow adding files with .gif extension on all the Content types which use the Media reference field?

- A. Edit the Content types and update Media field settings in Manage form display tab.
- **B. Edit the Media type Image and remove gif from "image" field settings in the Manage fields tab.**
- C. Edit the Content types and disallow .gif extension in the Media reference field settings.
- D. Edit the Media type Image and update media type settings to disallow .gif files.

Antwort: B

Begründung:

Because all three content types use a Media reference field that allows the Image media type, the actual uploaded file restrictions are controlled by the source field on the Media type, not by each content type's reference field. In Drupal, the Image media type contains an image field as its source field, and image/file fields have settings such as allowed file extensions. Drupal's Image module documentation states that image fields can be configured with settings including allowed extensions.

Therefore, to block GIF uploads everywhere this Image media type is used, you edit the Image media type, go to Manage fields, edit its image source field, and remove gif from the allowed extensions. Since all three content types reference that same media type, the restriction applies consistently across all of them. This is the most efficient and Drupal-native solution.

Option A is incorrect because the media reference field on a content type controls which media types may be referenced, not which file extensions the media type's source field accepts. Option C concerns form widget display, not file validation. Option D is too general; the actual extension restriction lives on the image field settings within the media type.

11. Frage

Your site has three Content types with a Media reference field. The field is configured to Media type as Image. You noticed that some users are adding animated GIF files while adding the content, which are very distracting.

How can you disallow adding files with .gif extension on all the Content types which use the Media reference field?

- A. Edit the Content types and update Media field settings in Manage form display tab.
- **B. Edit the Media type Image and remove gif from "image" field settings in the Manage fields tab.**
- C. Edit the Content types and disallow .gif extension in the Media reference field settings.
- D. Edit the Media type Image and update media type settings to disallow .gif files.

Antwort: B

12. Frage

You are using a contributed module named Lotus. You have read the module's documentation and ensured it is configured correctly. However, certain functionality of the module is not working as intended.

How should you find help?

(Select 2 options)

- A. Email the module's maintainer and ask for help.
- **B. Ask questions in the drupal-support channel on IRC or in the support channel on Drupal Slack group.**
- **C. Search for answers and ask questions in the module's issue queue on drupal.org.**
- D. Create a comment of type "support request" on the module's project page.

Antwort: B,C

Begründung:

Drupal 10 and Drupal 11 documentation strongly recommend using community-supported channels for troubleshooting contributed modules. The primary and most appropriate place to seek help is the module's issue queue on drupal.org, where users can search for existing issues, report bugs, and ask questions. This ensures transparency, allows maintainers and contributors to track problems, and benefits the wider community. Therefore, option A is correct.

Additionally, Drupal has active community communication platforms such as Drupal Slack and IRC channels (like #drupal-support), where developers and site builders collaborate and provide real-time assistance. These are officially recognized community support channels, making option B correct.

Option C is incorrect because Drupal project pages do not use general comments for support; instead, all discussions should happen in the issue queue. Option D is discouraged because directly emailing maintainers bypasses the public support process and is not aligned with Drupal community best practices.

Thus, the correct and recommended ways to find help are using the issue queue and community support channels.

13. Frage

You have installed a custom theme for your website, and you notice that the theme displays a Drupal icon as the favicon in the browser. As much as you love Drupal, you would like to remove this favicon and display your company's favicon instead.

How would you do this in the Drupal admin interface?

- A. Use a contributed module to inject CSS to hide the Druplicon and display your logo instead.
- B. Place the Site branding block in the appropriate region and enable the favicon under "Toggle branding elements".
- C. Go to Configuration > Basic Site Settings and upload your new favicon.
- **D. Go to Appearance > Settings and upload your new favicon.**

Antwort: D

Begründung:

In Drupal 10 and Drupal 11, favicon settings are managed at the theme level, not through general site configuration. The official Drupal theming documentation explains that each theme has its own configurable settings, including the ability to upload or replace the site's favicon.

To change the favicon, you navigate to Appearance # Settings (or specifically the active theme's settings page), where you will find an option to upload a custom favicon or use the default. This allows you to replace the default Drupal icon (Druplicon) with your organization's icon.

Option A is incorrect because the Site branding block controls elements like the logo and site name, not the favicon. Option C is incorrect because Basic Site Settings does not manage favicon configuration in modern Drupal versions. Option D is unnecessary and incorrect, as CSS is not used to change favicons.

Therefore, the correct and documented method is to update the favicon through the theme settings in the Appearance section, making option B correct.

14. Frage

You have a content type "Places" which lists tourist destinations of different countries. You would like the visitors to be able to mark their country while commenting on "Places". This does not apply to other content types.

How will you build this functionality?

- A. Create a new comment type with a new field "Country" and associate it with Places content type.
- B. Obtain country information from the user profile field while adding comments.
- C. Create a "Country" vocabulary and add a term reference field to "Places" content type.
- D. Use the GeoIP module to tag users with their locations.

Antwort: A

Begründung:

Drupal's Comment module supports creating different comment types and attaching them to content entities.

The official Comment module documentation states that Drupal can create new comment types that can be attached to content entities, and the detailed comment documentation explains that when you create a comment type and choose the target entity type as Content, that comment type becomes available when adding a comment field to a content type.

Drupal's field documentation also explains that fields on comments are defined at the content-type level, on the Comment fields tab of the content type edit page. When you add a field for comments, each comment on content items of that type gets that field. Drupal even gives an example of adding a field to comments for one content type but not another, which matches this requirement exactly.

So the right solution is to create a new comment type for Places comments, add a Country field to that comment type, and then use that comment type on the Places content type only. The other options either store the data in the wrong place or do not make it specific to comments on Places.

15. Frage
