Microsoft GitHub Advanced Security Sample Questions (Q23-Q28):

NEW QUESTION # 23

What happens when you enable secret scanning on a private repository?

- **A. GitHub performs a read-only analysis on the repository.**
- B. Repository administrators can view Dependabot alerts.
- C. Dependency review, secret scanning, and code scanning are enabled.
- D. Your team is subscribed to security alerts.

Answer: A

Explanation:

When secret scanning is enabled on a private repository, GitHub performs a read-only analysis of the repository's contents. This includes the entire Git history and files to identify strings that match known secret patterns or custom-defined patterns. GitHub does not alter the repository, and enabling secret scanning does not automatically enable code scanning or dependency review - each must be configured separately.

NEW QUESTION # 24

Which patterns are secret scanning validity checks available to?

- A. Partner patterns
- B. High entropy strings
- C. Custom patterns
- D. Push protection patterns

Answer: A

Explanation:

Validity checks - where GitHub verifies if a secret is still active - are available for partner patterns only. These are secrets issued by GitHub's trusted partners (like AWS, Slack, etc.) and have APIs for GitHub to validate token activity status.

Custom patterns and high entropy patterns do not support automated validity checks.

NEW QUESTION # 25

Which of the following options would close a Dependabot alert?

- A. Viewing the Dependabot alert on the Dependabot alerts tab of your repository
- B. Creating a pull request to resolve the vulnerability that will be approved and merged
- C. Leaving the repository in its current state
- D. Viewing the dependency graph

Answer: B

Explanation:

A Dependabot alert is only marked as resolved when the related vulnerability is no longer present in your code - specifically after you merge a pull request that updates the vulnerable dependency.

Simply viewing alerts or graphs does not affect their status. Ignoring the alert by leaving the repo unchanged keeps the vulnerability active and unresolved.

NEW QUESTION # 26

When configuring code scanning with CodeQL, what are your options for specifying additional queries? (Each answer presents part of the solution. Choose two.)

- A. Packs
- B. Scope
- C. github/codeql
- D. Queries

Answer: A,D

Explanation:

You can customize CodeQL scanning by including additional query packs or by specifying individual queries:

Packs: These are reusable collections of CodeQL queries bundled into a single package.

Queries: You can point to specific files or directories containing .ql queries to include in the analysis.

github/codeql refers to a pack by name but is not a method or field. Scope is not a valid field used for configuration in this context.

NEW QUESTION # 27

Which details do you have to provide to create a custom pattern for secret scanning? (Each answer presents part of the solution. Choose two.)

- A. The secret format
- B. A list of repositories to scan
- C. The name of the pattern
- D. Additional match requirements for the secret format

Answer: A,C

Explanation:

When defining a custom pattern for secret scanning, two key fields are required:

Name of the pattern: A unique label to identify the pattern

Secret format: A regular expression that defines what the secret looks like (e.g., token format) You can optionally specify additional match requirements (like required context keywords), but they're not mandatory. Listing repositories is also not part of the required fields during pattern creation.
