A person's career prospects are often linked to his abilities, so an international and authoritative certificate is the best proof of one's ability. The SAA-C03 exam certification is a proof of your IT ability. To pass this exam also needs a lot of preparation. The SAA-C03 Exam Materials provided by Real4test are collected and sorted out by experienced team. Now you can have these precious materials. You can safely buy a full set of SAA-C03 exam software in our official website.

Amazon SAA-C03 certification exam is designed for professionals who are looking to advance their careers in cloud computing and AWS. It is ideal for solutions architects, developers, and IT professionals who want to demonstrate their expertise and knowledge in designing and deploying secure and highly available applications on the AWS platform. SAA-C03 Exam covers a broad range of topics, including AWS services, security, networking, database, and storage, among others.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q211-Q216):

NEW QUESTION # 211

A company uses Amazon RDS for PostgreSQL to run its applications in the us-east-1 Region.

The company also uses machine learning (ML) models to forecast annual revenue based on near real-time reports. The reports are generated by using the same RDS for PostgreSQL database.

The database performance slows during business hours. The company needs to improve database performance. Which solution will meet these requirements MOST cost-effectively?

- **A. Create a read replica in us-east-1. Configure the reports to be generated from the read replica.**
- B. Create a cross-Region read replica. Configure the reports to be generated from the read replica.
- C. Use AWS Data Migration Service (AWS DMS) to logically replicate data to a new database. Configure the reports to be generated from the new database.
- D. Activate Multi-AZ DB instance deployment for RDS for PostgreSQL. Configure the reports to be generated from the standby database.

Answer: A

Explanation:

To improve the performance of the primary RDS PostgreSQL database during business hours and reduce the load, the best solution is to create a read replica in the same region (us-east-1).

This will offload the read-heavy operations (like generating reports) to the replica, reducing the burden on the primary instance, which improves overall performance. Additionally, read replicas provide near real-time replication, making them ideal for real-time reporting use cases.

Option A (cross-Region read replica): This adds unnecessary latency for real-time reporting and increased costs due to cross-region data transfer.

Option B (Multi-AZ): Multi-AZ deployments are for high availability and disaster recovery but won't offload the read traffic, as the standby database cannot serve read requests.

Option C (AWS DMS replication): This adds complexity and is not as cost-effective as using an RDS read replica for the same region.

NEW QUESTION # 212

A company wants to improve its ability to clone large amounts of production data into a test environment in the same AWS Region.

The data is stored in Amazon EC2 instances on Amazon Elastic Block Store (Amazon EBS) volumes. Modifications to the cloned data must not affect the production environment. The software that accesses this data requires consistently high I/O performance.

A solutions architect needs to minimize the time that is required to clone the production data into the test environment.

Which solution will meet these requirements?

- A. Take EBS snapshots of the production EBS volumes. Restore the snapshots onto EC2 instance store volumes in the test

environment.

- B. Take EBS snapshots of the production EBS volumes. Turn on the EBS fast snapshot restore feature on the EBS snapshots. Restore the snapshots into new EBS volumes. Attach the new EBS volumes to EC2 instances in the test environment.
- C. Take EBS snapshots of the production EBS volumes. Create and initialize new EBS volumes. Attach the new EBS volumes to EC2 instances in the test environment before restoring the volumes from the production EBS snapshots.
- D. Configure the production EBS volumes to use the EBS Multi-Attach feature. Take EBS snapshots of the production EBS volumes. Attach the production EBS volumes to the EC2 instances in the test environment.

Answer: B

NEW QUESTION # 213

A company stores sensitive customer data in an Amazon DynamoDB table. The company frequently updates the data. The company wants to use the data to personalize offers for customers.

The company's analytics team has its own AWS account. The analytics team runs an application on Amazon EC2 instances that needs to process data from the DynamoDB tables. The company needs to follow security best practices to create a process to regularly share data from DynamoDB to the analytics team.

Which solution will meet these requirements?

- A. Allow public access to the DynamoDB table. Create an IAM user that has permission to access DynamoDB. Share the IAM user with the analytics team.
- B. Export the required data from the DynamoDB table to an Amazon S3 bucket as multiple JSON files. Provide the analytics team with the necessary IAM permissions to access the S3 bucket.
- C. Allow public access to the DynamoDB table. Create an IAM user that has read-only permission for DynamoDB. Share the IAM user with the analytics team.
- D. Create a cross-account IAM role. Create an IAM policy that allows the AWS account ID of the analytics team to access the DynamoDB table. Attach the IAM policy to the IAM role. Establish a trust relationship between accounts.

Answer: D

Explanation:

Using cross-account IAM roles is the most secure and scalable way to share data between AWS accounts.

A trust relationship allows the analytics team's account to assume the role in the main account and access the DynamoDB table directly.

A is feasible but involves data duplication and additional costs for storing the JSON files in S3.

B and C violate security best practices by allowing public access to sensitive data and sharing credentials, which is highly discouraged.

NEW QUESTION # 214

A business application is hosted on Amazon EC2 and uses Amazon S3 for encrypted object storage. The chief information security officer has directed that no application traffic between the two services should traverse the public internet.

Which capability should the solutions architect use to meet the compliance requirements?

- A. VPC endpoint
- B. Virtual private gateway
- C. AWS Key Management Service (AWS KMS)
- D. Private subnet

Answer: A

NEW QUESTION # 215

A company has an API that receives real-time data from a fleet of monitoring devices. The API stores this data in an Amazon RDS DB instance for later analysis. The amount of data that the monitoring devices send to the API fluctuates. During periods of heavy traffic, the API often returns timeout errors.

After an inspection of the logs, the company determines that the database is not capable of processing the volume of write traffic that comes from the API. A solutions architect must minimize the number of connections to the database and must ensure that data is not lost during periods of heavy traffic.

Which solution will meet these requirements?

- A. Modify the API to write incoming data to an Amazon Simple Queue Service (Amazon SQS) queue. Use an AWS Lambda function that Amazon SQS invokes to write data from the queue to the database.
- B. Increase the size of the DB instance to an instance type that has more available memory.
- C. Modify the API to write incoming data to an Amazon Simple Notification Service (Amazon SNS) topic. Use an AWS Lambda function that Amazon SNS invokes to write data from the topic to the database.
- D. Modify the DB instance to be a Multi-AZ DB instance. Configure the application to write to all active RDS DB instances.

Answer: A

Explanation:

Explanation

Using Amazon SQS will help minimize the number of connections to the database, as the API will write data to a queue instead of directly to the database. Additionally, using an AWS Lambda function that Amazon SQS invokes to write data from the queue to the database will help ensure that data is not lost during periods of heavy traffic, as the queue will serve as a buffer between the API and the database.
