Google Professional-Cloud-Architect exam questions & answers, Professional-Cloud-Architect real exams

In order to serve you better, we have a complete system for you if you choose us. We offer you free demo for Professional-Cloud-Architect exam materials for you to have a try, so that you can have a better understanding of what you are going to buy. If you are quite satisfied with Professional-Cloud-Architect exam materials and want the complete version, you just need to add them to cart and pay for it. You can receive the download link and password within ten minutes for Professional-Cloud-Architect Training Materials, and if you don't receive, you can contact with us, and we will solve the problem for you. We also have after-service stuff,

if you have any questions about Professional-Cloud-Architect exam materials, you can consult us.

Professionals willing to become a part of Google and excel at every career front can make this happen if they earn the Google Professional Cloud Architect certification. Passing its associated exam is the easiest way to leverage their abilities in Google Cloud Technologies and cement feet in the industry.

Google Certified Professional - Cloud Architect (GCP) Sample Questions (Q235-Q240):

NEW QUESTION # 235

At Dress4Win, an operations engineer wants to create a low-cost solution to remotely archive copies of database backup files.

The database files are compressed tar files stored in their current data center.

How should he proceed?

- A. Create a Cloud Storage Transfer Service job to copy the files to a Regional Storage bucket.
- B. Create a Cloud Storage Transfer Service Job to copy the files to a Coldline Storage bucket.
- C. Create a cron script using gsutil to copy the files to a Regional Storage bucket.
- **D. Create a cron script using gsutil to copy the files to a Coldline Storage bucket.**

Answer: D

Explanation:

Explanation/Reference:

Explanation:

Follow these rules of thumb when deciding whether to use gsutil or Storage Transfer Service:

- * When transferring data from an on-premises location, use gsutil.
- * When transferring data from another cloud storage provider, use Storage Transfer Service.
- * Otherwise, evaluate both tools with respect to your specific scenario.

Use this guidance as a starting point.

The specific details of your transfer scenario will also help you determine which tool is more appropriate.

NEW QUESTION # 236

You have deployed several instances on Compute Engine. As a security requirement, instances cannot have a public IP address. There is no VPN connection between Google Cloud and your office, and you need to connect via SSH into a specific machine without violating the security requirements. What should you do?

- A. Configure Identity-Aware Proxy (IAP) for the instance and ensure that you have the role of IAP-secured Tunnel User. Use the gcloud command line tool to ssh into the instance.
- B. Add all instances to an unmanaged instance group. Configure TCP Proxy Load Balancing with the instance group as a backend. Connect to the instance using the TCP Proxy IP.
- **C. Create a bastion host in the network to SSH into the bastion host from your office location. From the bastion host, SSH into the desired instance.**
- D. Configure Cloud NAT on the subnet where the instance is hosted. Create an SSH connection to the Cloud NAT IP address to reach the instance.

Answer: C

Explanation:

Reference: <https://cloud.google.com/solutions/connecting-securely>

NEW QUESTION # 237

The Dress4Win security team has disabled external SSH access into production virtual machines (VMs) on Google Cloud Platform (GCP).

The operations team needs to remotely manage the VMs, build and push Docker containers, and manage Google Cloud Storage objects.

What can they do?

- A. Develop a new access request process that grants temporary SSH access to cloud VMs when an

operations engineer needs to perform a task.

- **B. Configure a VPN connection to GCP to allow SSH access to the cloud VMs.**
- C. Grant the operations engineer access to use Google Cloud Shell.
- D. Have the development team build an API service that allows the operations team to execute specific remote procedure calls to accomplish their tasks.

Answer: B

NEW QUESTION # 238

For this question, refer to the Mountkirk Games case study. You are in charge of the new Game Backend Platform architecture. The game communicates with the backend over a REST API.

You want to follow Google-recommended practices. How should you design the backend?

- A. Create an instance template for the backend. For every region, deploy it on a single-zone managed instance group. Use an L4 load balancer.
- **B. Create an instance template for the backend. For every region, deploy it on a multi-zone managed instance group. Use an L4 load balancer.**
- C. Create an instance template for the backend. For every region, deploy it on a multi-zone managed instance group. Use an L7 load balancer.
- D. Create an instance template for the backend. For every region, deploy it on a single-zone managed instance group. Use an L7 load balancer.

Answer: B

NEW QUESTION # 239

For this question, refer to the Dress4Win case study.

As part of their new application experience, Dress4Win allows customers to upload images of themselves. The customer has exclusive control over who may view these images.

Customers should be able to upload images with minimal latency and also be shown their images quickly on the main application page when they log in. Which configuration should Dress4Win use?

- A. Use a distributed file system to store customers' images. As storage needs increase, add more persistent disks and/or nodes. Assign each customer a unique ID, which sets each file's owner attribute, ensuring privacy of images.
- B. Store image files in a Google Cloud Storage bucket. Add custom metadata to the uploaded images in Cloud Storage that contains the customer's unique ID.
- **C. Store image files in a Google Cloud Storage bucket. Use Google Cloud Datastore to maintain metadata that maps each customer's ID and their image files.**
- D. Use a distributed file system to store customers' images. As storage needs increase, add more persistent disks and/or nodes. Use a Google Cloud SQL database to maintain metadata that maps each customer's ID to their image files.

Answer: C
