The CIPS L4M7 certification exam also enables you to stay updated and competitive in the market which will help you to gain more career opportunities. Do you want to gain all these CIPS Whole Life Asset Management (L4M7) certification exam benefits? Looking for the quick and complete CIPS L4M7 exam dumps preparation way that enables you to pass the L4M7 Certification Exam with good scores? If your answer is yes then you are at the right place and you do not need to go anywhere. Just download the PrepAwayTest L4M7 Questions and start CIPS Whole Life Asset Management (L4M7) exam preparation without wasting further time.

CIPS Whole Life Asset Management Sample Questions (Q273-Q278):

NEW QUESTION # 273

Which of the following is the Japanese word for 'billboard' or 'signboard'?

- A. Kaizen
- B. Poka-Yoke
- C. Muda
- **D. Kanban**

Answer: D

Explanation:

Kanban (看板) (signboard or billboard in Japanese) is a scheduling system for lean manufacturing and just-in-time manufacturing (JIT).

Poka-yoke (ポカヨケ, [poka yoke]) is a Japanese term that means "mistake-proofing" or "inadvertent error prevention". A poka-yoke is any mechanism in any process that helps an equipment operator avoid (yokeru) mistakes (poka). Its purpose is to eliminate product defects by preventing, correcting, or drawing attention to human errors as they occur.

Kaizen is a concept referring to business activities that continuously improve all functions and involve all employees from the CEO to the assembly line workers. Kaizen (改善) is the Sino-Japanese word for "improvement". Kaizen also applies to processes, such as purchasing and logistics, that cross organizational boundaries into the supply chain.

Muda (無駄, on'yomi reading) is a Japanese word meaning "futility; uselessness; wastefulness", and is a key concept in lean process thinking, like the Toyota Production System (TPS) as one of the three types of deviation from optimal allocation of resources (the others being mura and muri). Waste reduction is an effective way to increase profitability.

NEW QUESTION # 274

A cardiac department within a local hospital carries out a small number of specialist emergency care heart surgeries each year. The devices implanted in the patients can vary significantly depending on the condition of the patient. Therefore, the hospital requires a stock management technique that minimizes the cost of holding several different items of stock, without impacting the critical service levels, and allowing the supplier to retain the title of the stock until the hospital's cardiac team utilizes it. Which of the following stock management techniques would enable the hospital to achieve this?

- A. Increasing the hospital's overall stock levels in all supplies
- **B. Having vendor-owned stock in the hospital stores**
- C. Having strategically placed hospital-owned safety stock in various hospital storerooms
- D. Subjective stock forecasting being undertaken by the doctors

Answer: B

Explanation:

Vendor-owned stock allows the hospital to keep essential items available without holding costs. The vendor retains ownership until the item is used, helping the hospital avoid large upfront costs for low-frequency items. This technique aligns with whole-life asset management principles by reducing inventory holding costs while ensuring critical items are readily accessible.

NEW QUESTION # 275

A brewery sells its beer in aluminum cans. It recycles the cans by using contractors to collect and mold the used cans. This is an example of...?

- A. Reuse
- B. Open-loop recycling
- C. Carbon recycling
- **D. Closed-loop recycling**

Answer: D

Explanation:

There are two main processes of recycling - open loop recycling and closed loop recycling.

Open Loop Recycling

Open loop recycling is a method that delays disposal by converting manufactured goods and spent materials into both new raw materials, which can be used for a manufacturing purpose, as a fuel source for a different manufacturing process and waste products.

Typically, materials recycled through open-loop recycling will be used for purposes different from their original purpose.

This means that the input into the recycling process is converted to a new raw material, which can be used as an input into another manufacturing process.

Materials in an open loop recycling process are treated using various forms of treatment including heat, chemical reactions, or physical crushing.

Closed Loop Recycling

Closed loop recycling is a process where waste is collected, recycled and then used again to make the same product it came from.

This process is restorative and regenerative by design and aims to keep materials at their highest utility and value always.

Closed loop recycling is focused on resource sustainability, which means that recycling of a material can be done indefinitely without degradation of properties. In this case, conversion of the used product back to raw material allows repeated making of the same product, which helps hazardous waste generators reduce carbon footprint and achieve corporate sustainability initiatives.

Closed-loop recycling is common in specialized industries, such as the computer and battery industries, which use expensive or complex goods that cannot easily be broken down post-consumption into constituent materials.

A prime example of a closed-loop recycling process is the recycling of aluminum cans. Aluminum can be recycled to form new cans with little material degradation or waste creation.

NEW QUESTION # 276

In just in time production system, when is an upstream production triggered?

- A. When the production workers are idle
- **B. When downstream operations summon the upstream production**
- C. When the inventory level reaches the reorder point
- D. After the management team forecasts the future demands

Answer: B

Explanation:

Along with Jidoka, Just-in-time (JIT) production is one of the pillars of the two Toyota Production System. It is a production method that fundamentally changed the way large-scale production occurred in the 20th century, and is the basis for Lean Manufacturing (Lean for short), which is the school of thought many modern companies have modeled themselves after.

JIT production is often called a pull system because instead of using traditional push production where scheduling is done based on historical data and demand forecasting, production is scheduled based on actual customer orders. Rather than predicting demands from customers, the JIT method requires that actual customer demand exists. Production doesn't begin before an order triggers it.

This system not only reduces the amount of extra inventory, but also reduces the amount of work in progress at one time.

NEW QUESTION # 277

Which type of codes can a barcode laser scanner (linear scanner) read?

- A. Aztec code

- B. Numerical code
- C. QR code
- D. 1D barcode

Answer: D

Explanation:

One-dimensional (or 1D) barcodes systematically represent data by varying the widths and spacings of parallel lines. These include some of the most traditional and well-recognized barcode types, such as the UPC and EAN codes. 1D barcodes are also commonly referred to as linear barcodes.

Two-dimensional (2D) barcodes look like squares or rectangles that contain many small, individual dots. QR codes, Data matrix and Aztec codes are examples of 2D barcodes. Numerical code contains all numbers, no letters. There are two different scan engine types (laser scanner versus imager) for interpreting the information provided in the barcode. Many companies producing the technology capable of reading the barcode data uses the term "scanning" regardless of the type of scan engine used. For the purposes of these FAQs, we are trying to draw a clearer distinction for you.

Linear (1D) codes can be scanned with a traditional laser scanner. A laser scan engine uses a laser and mirror to create the bar that scans the information. 1D barcode scanners will only interpret the linear barcode scanning technology. 1D barcode scanners are typically less expensive since the type of encryptions they can decode is limited.
