Salesforce Certified Identity and Access Management Architect certification is designed for professionals who have a deep understanding of Salesforce's identity and access management capabilities. It is an advanced-level certification that validates an individual's expertise in designing and implementing complex identity and access management solutions using Salesforce.

Salesforce Certified Identity and Access Management Architect certification exam covers a broad range of topics related to identity and access management, including authentication, authorization, single sign-on, federation, password policies, and security protocols. Candidates are expected to have a deep understanding of the Salesforce platform, as well as experience working with complex enterprise environments. Identity-and-Access-Management-Architect Exam also assesses a candidate's ability to design and implement identity and access management solutions that meet the unique needs of different types of organizations, such as healthcare, financial services, and government agencies.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q95-Q100):

NEW QUESTION # 95

An Identity and Access Management (IAM) architect is tasked with unifying multiple B2C Commerce sites and an Experience Cloud community with a single identity. The solution needs to support more than 1,000 logins per minute. What should the IAM do to fulfill this requirement?

- A. Configure both the community and the commerce sites as OAuth2 RPs (relying party) with an external identity provider.
- B. Configure community as a Security Assertion Markup Language (SAML) identity provider and enable Just-in-Time Provisioning to B2C Commerce.
- C. Confirm performance considerations with Salesforce Customer Support due to high peaks.
- D. Create a default account for capturing all ecommerce contacts registered on the community because person Account is not supported for this case.

Answer: A

Explanation:

According to the Salesforce documentation², OAuth2 RPs (relying parties) are applications that use OAuth 2.0 for authentication and authorization with an external identity provider. This allows users to log in to multiple applications with a single identity provider account. The identity provider issues an access token to the relying party, which can be used to access protected resources on behalf of the user. This solution can support high volumes of logins per minute and unify multiple B2C Commerce sites and an Experience Cloud community with a single identity.

NEW QUESTION # 96

Universal Containers (UC) has decided to use Identity Connect as its identity provider. UC uses Active Directory (AD) and has a team that is very familiar and comfortable with managing AD groups. UC would like to use AD groups to help configure Salesforce users. Which three actions can AD groups control through Identity Connect? Choose 3 answers

- A. Granting report folder access
- B. Role Assignment
- C. Public Group Assignment
- D. Permission sets assignment
- E. Custom permission assignment

Answer: B,C,D

Explanation:

Explanation

AD groups can control public group assignment, role assignment, and permission set assignment through Identity Connect. Identity Connect is a tool that integrates Microsoft Active Directory (AD) user accounts with Salesforce user records¹. It allows Salesforce admins to leverage the existing user data and group memberships in AD to automate user provisioning and deprovisioning in Salesforce. Identity Connect can map AD groups to Salesforce public groups, roles, and permission sets, and assign them to users based on their group membership². This way, AD groups can control the access level and visibility of users in Salesforce. AD groups cannot control granting report folder access or custom permission assignment through Identity Connect. These are not supported features of Identity Connect. Report folder access is controlled by the folder sharing settings in Salesforce. Custom permission assignment is controlled by the custom permission settings in Salesforce. NEW QUESTION # 97

Northern Trail Outfitters (NTO) uses Salesforce for Sales Opportunity Management. Okta was recently brought in to Just-in-Time (JIT) provision and authenticate NTO users to applications. Salesforce users also use Okta to authorize a Forecasting web application to access Salesforce records on their behalf.

Which two roles are being performed by Salesforce?

Choose 2 answers

- A. SAML Service Provider
- B. OAuth Resource Server

- C. OAuth Client
- D. SAML Identity Provider

Answer: A,C

NEW QUESTION # 98

Northern Trail Outfitters want to allow its consumer to self-register on its business-to-consumer (B2C) portal that is built on Experience Cloud. The identity architect has recommended to use Person Accounts.

Which three steps need to be configured to enable self-registration using person accounts?

Choose 3 answers

- A. Contact Salesforce Support to enable person accounts.
- B. Enable access to person and business account record types under Public Access Settings.
- C. Contact Salesforce Support to enable business accounts.
- D. Set organization-wide default sharing for Contact to Public Read Only.
- E. Under Login and Registration settings, ensure that the default account field is empty.

Answer: A,B,E

Explanation:

Explanation

To enable self-registration using person accounts for consumers on a B2C portal built on Experience Cloud, the identity architect should configure three steps:

Enable access to person and business account record types under Public Access Settings. Public Access Settings are settings that control the access level and permissions for guest users on Experience Cloud sites. By enabling access to person and business account record types, the identity architect can allow guest users to create person accounts or business accounts when they self-register on the portal.

Under Login and Registration settings, ensure that the default account field is empty. Login and Registration settings are settings that control the login and registration options for Experience Cloud sites. By ensuring that the default account field is empty, the identity architect can prevent guest users from being associated with a default account when they self-register on the portal.

Contact Salesforce Support to enable person accounts. Person accounts are a type of account that combines an individual consumer with an account record. Person accounts are not enabled by default in Salesforce orgs and require contacting Salesforce Support to enable them. References: Public Access Settings, Login and Registration Settings, Person Accounts

NEW QUESTION # 99

Universal Containers (UC) would like to enable SSO between their existing Active Directory infrastructure and Salesforce. The team prefers to manage all users in Active Directory and would like to avoid doing any initial setup of users in Salesforce directly, including the correct assignment of profiles, roles and groups.

Which two optimal solutions should UC use to provision users in Salesforce? Choose 2 answers

- A. Use Active Directory Federation Services to sync users from Active Directory to Salesforce.
- B. Use the Salesforce REST API to sync users from Active Directory to Salesforce.
- C. Use Identity Connect to sync users from Active Directory to Salesforce.
- D. Use an app exchange product to sync users from Active Directory to Salesforce.

Answer: C,D
