NEW QUESTION # 688
After a failed update, an application no longer launches and generates the following error message: Application needs to be repaired. Which of the following Windows 10 utilities should a technician use to address this concern?

- A. Administrator Tools
- B. Programs and Features
- C. Recovery
- D. Device Manager

Answer: C

Explanation:
Recovery is a Windows 10 utility that can be used to address the concern of a failed update that prevents an application from launching. Recovery allows the user to reset the PC, go back to a previous version of Windows, or use advanced startup options to troubleshoot and repair the system2. Device Manager, Administrator Tools, and Programs and Features are not Windows 10 utilities that can fix a failed update.

NEW QUESTION # 689
A network technician installed a SOHO router for a home office user. The user has read reports about home routers being targeted by malicious actors and then used in DDoS attacks.
Which of the following can the technician MOST likely do to defend against this threat?

- A. Disable the SSID broadcast.
- B. Change the default credentials.
- C. Add network content filtering.
- D. Configure port forwarding.

Answer: B

Explanation:
One of the most effective ways to defend against malicious actors targeting home routers for DDoS attacks is to change the default credentials of the router. The default credentials are often well-known or easily guessed by attackers, who can then access and compromise the router settings and firmware. By changing the default credentials to strong and unique ones, a technician can prevent unauthorized access and configuration changes to the router. Adding network content filtering may help block some malicious or

unwanted websites but may not prevent attackers from exploiting router vulnerabilities or backdoors. Disabling the SSID broadcast may help reduce the visibility of the wireless network but may not prevent attackers from scanning or detecting it.
Configuring port forwarding may help direct incoming traffic to specific devices or services but may not prevent attackers from sending malicious packets or requests to the router. References: CompTIA A+ Core 2 (220-1002) Certification Exam Objectives Version 4.0, Domain 3.3

NEW QUESTION # 690
A technician is troubleshooting a connectivity issue and wants to verify that traffic is flowing to the correct upstream locations. Which of the following commands should the technician use?

- A. nslookup
- B. net use
- C. netstat
- D. tracert

Answer: D

Explanation:
The tracert (Trace Route) command is used to track the path that packets take from a source device to a destination device across a network. This helps technicians identify where traffic is being routed and diagnose connectivity issues. It shows each hop along the path and measures latency between each node.
net use (Option A): Used to connect to shared network resources, such as shared folders or printers. Not relevant for tracing traffic.
nslookup (Option B): Used for querying DNS servers to resolve domain names to IP addresses. It does not trace network paths.
netstat (Option D): Displays active network connections and statistics, but it does not trace routes like tracert does.
