Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q235-Q240):

NEW QUESTION # 235

A web client submits a request to `http://localhost:8081?accountType=personal`. The query parameter is captured using a Set Variable transformer to a variable named `accountType`.

What is the correct DataWeave expression to log `accountType`?

- A. `Account Type: # [attributes.accountType]`
- B. `Account Type: #[message.inboundProperties.accountType]`
- C. `Account Type: #[flowVars.accountType]`
- D. **Account Type: #[vars.accountType]**

Answer: D

Explanation:

`vars`: Keyword for accessing a variable, for example, through a DataWeave expression in a Mule component, such as the Logger, or from an Input or Output parameter of an operation. If the name of your variable is `myVar`, you can access it like this: `vars.myVar`
Hence correct answer is `Account Type: #[vars.accountType]`

NEW QUESTION # 236

Refer to the exhibits.

What payload and variable are logged at the end of the main flow?

- A. **[[5, 10, 15, 20], 5]**
- B. [[5, 10, 15, 20], 1]
- C. [Req5Req10,Req15Req20, 5]
- D. [[Req5, Req10, Req15, Req20], 5]

Answer: A

Explanation:

Correct answer is `[[5, 10, 15, 20], 5]`

Key thing to note here is that any changes made to payload in for each loop are not available outside for each scope where as variable value updated in for each loop is visible out side for each loop too.

In this example , sequence can be described as follows

1) Payload is set to the value `[5, 10, 15, 20]`

2) Variable is set to the value of 1

3) For each loop is executed four times and in each loop payload value is updated to append "Req" and variable is count is increased by 1

4) Once control comes out of for each , payload changes made within for each are not visible. Hence payload at this point of time is equal to payload available before entering for each loop which was `[5, 10, 15, 20]`.

Similarly variable value updated in for each loop is also available outside hence variable value is 5 as it was updated in loop.

5) Hence correct answer is `[[5, 10, 15, 20], 5]`

For Each Scope

The For Each scope splits a payload into elements and processes them one by one through the components that you place in the scope. It is similar to a for-each/for loop code block in most programming languages and can process any collection, including lists

and arrays. The collection can be any supported content type, such as application/json, application/java, or application/xml.

General considerations about the For Each scope:

By default, For Each tries to split the payload. If the payload is a simple Java collection, the For Each scope can split it without any configuration. The payload inside the For Each scope is each of the split elements.

Attributes within the original message are ignored because they are related to the entire message.

For Each does not modify the current payload. The output payload is the same as the input.

For non-Java collections, such as XML or JSON, use a DataWeave expression to split data. Use the Collection field for this purpose.

NEW QUESTION # 237

Refer to the exhibits. A database Address table contains a ZIPCODE column and an increasing ID column. The Address table currently contains four (4) records. The On Table Row Database listener is configured with its watermark set to the Address table's ZIPCODE column and then the Mule application is run in Anypoint Studio for the first time, and the On Table Row Database listener polls the Address table.

A new row is added to the database with ID=5 and ZIPCODE-90006, and then the On Table Row Database listener polls the database again.

After the next execution of the On Table Row Database listener polling, what database rows have been processed by the Mule flow since the Mule application was started?

- A. ID ZIPCODE
1 90001
2 90005
3 90009
4 90001
- B. ID ZIPCODE
1 90001
