It is well known that even the best people fail sometimes, not to mention the ordinary people. In face of the D-PVM-OE-01 exam, everyone stands on the same starting line, and those who are not excellent enough must do more. Every year there are a large number of people who can't pass smoothly. If you happen to be one of them, our D-PVM-OE-01 Learning Materials will greatly reduce your burden and improve your possibility of passing the exam. Our advantages of time-saving and efficient can make you no longer be afraid of the D-PVM-OE-01 exam, and I'll tell you more about its benefits next.

EMC D-PVM-OE-01 Exam Syllabus Topics:

Topic	Details
Topic 1	• Solutions Enabler 10 Implementation: This section of the exam measures the skills of Infrastructure Engineers and focuses on the fundamentals of Solutions Enabler. Candidates must understand its installation, upgrade processes, gatekeeper management, and daemon functions across different platforms. One crucial skill tested is managing Solutions Enabler daemons.

Topic 2	• PowerMax Family Monitoring and Workload Planning: This section of the exam measures the skills of Performance Analysts and focuses on monitoring storage environments and workload planning using Unisphere for PowerMax. Candidates must understand how to track performance metrics, detect issues, and optimize workloads to enhance storage efficiency. One key skill tested is monitoring storage health through Unisphere.
Topic 3	• PowerMax Family Storage Provisioning: This section of the exam measures the skills of Storage Administrators and covers the architecture, configurations, and management of the PowerMax family. Candidates must understand system models, port and device management, and provisioning methods using Unisphere for PowerMax. They are expected to perform service level-based provisioning and allocate storage through auto-provisioning groups. One key skill assessed is configuring storage using Unisphere for PowerMax.
Topic 4	• PowerMax Family Management in a Virtual Environment: This section of the exam measures the skills of Virtualization Engineers and evaluates the integration of PowerMax storage in virtualized environments. Candidates must understand VMware vSphere, the functionalities of Virtual Storage Integrator (VSI), and how to monitor virtualized workloads using Unisphere for PowerMax. One critical skill assessed is tracking virtual machine storage performance.
Topic 5	• Unisphere for PowerMax 10 Implementation and Administration: This section of the exam measures the skills of System Administrators and covers the implementation and management of Unisphere for PowerMax. Candidates must understand the installation process, post-installation tasks, and interface navigation to efficiently operate the platform. One key skill evaluated is setting up Unisphere for PowerMax.

EMC Dell Technologies PowerMax Operate Sample Questions (Q138-Q143):

NEW QUESTION # 138
A customer has an existing host with two 100 GB volumes that are assigned from existing PowerMax storage.
They would like to add three additional volumes of 100 GB each and change the service level that is assigned to the storage group from Gold to Platinum to support the current application SLO requirements.

Answer:

Explanation:
See the explanation for step by step solution.
Explanation:
You want a detailed, step-by-step guide on how to add three 100 GB volumes to an existing host and change the service level of the associated storage group from Gold to Platinum on a PowerMax array, using the Unisphere for PowerMax interface shown in the image.
Here's a comprehensive guide, broken down into manageable steps:
Phase 1: Provisioning the New Volumes
Step 1: Log in to Unisphere for PowerMax
* Open your web browser and enter the URL for your Unisphere for PowerMax management interface.
* Log in with your administrator credentials.

Step 2: Navigate to Storage Groups

* In the left-hand navigation pane, click onStorageto expand the storage management section.

* Click onStorage Groupsunder the Storage section. This will display a list of existing storage groups on your PowerMax array.

Step 3: Locate the Target Storage Group

* Identify the storage group that currently contains the host's existing two 100 GB volumes.

* Tip:You can find this by:

* Looking at the "Hosts" tab within each storage group's details. It will list the hosts connected to that storage group.

* If you know the host's name, you might be able to search for it using the Unisphere search bar (if available).

Step 4: Initiate Adding Volumes

* Once you've found the correct storage group, select it by clicking on its name.

* Look for a button or option related to adding volumes. The exact wording might vary slightly depending on your Unisphere version, but it could be:

* "Add to Storage Group"

* "+"(a plus icon, which often signifies adding something)

* "Add Volumes"

* Click this button to start the process of adding new volumes to the storage group.

Step 5: Configure Volume Details

* A new window or panel will appear, allowing you to specify the characteristics of the new volumes.

* Select "Create new volumes"

* Number of Volumes:Enter 3 in the field for the number of volumes.

* Capacity:Enter 100 in the field for the capacity of each volume. Make sure the unit is set to GB.

* Volume Name (Optional):You can give the volumes a specific name or prefix, or you can let Unisphere auto-generate names.

* Service Level:Since the final goal is to move the entire Storage Group to platinum, you can either set this to platinum now or change it for the whole group later.

* Other Settings:Review any other available settings (e.g., thin provisioning, data reduction). In most cases, the default settings should be fine, but adjust them if needed based on your environment's best practices.

Step 6: Execute Volume Creation

* After you've configured all the volume settings, review them carefully to make sure they are correct.

* Click the button to execute the operation. This button might be labeled:

* "Run Now"

* "OK"

* "Finish"

* "Apply"

* Unisphere will start creating the new volumes. This might take a few moments.

Phase 2: Changing the Storage Group's Service Level

Step 7: Navigate Back to Storage Groups

* Once the volume creation is complete, go back to the list of storage groups. You can usually do this by clicking "Storage Groups" in the left-hand navigation pane again.

Step 8: Select the Target Storage Group

* Find the same storage group you worked with in Phase 1 (the one containing the host's volumes).

* Click on the storage group's name to open its properties.

Step 9: Modify the Service Level

* Look for a setting related to the "Service Level." It might be a dropdown menu, a field you can edit, or a link to a separate settings page.

* Change the Service Level fromGoldtoPlatinum.

Step 10: Save the Changes

* Click the button to save the changes to the storage group's service level. This button might be labeled:

* "Apply"

* "Save"

* "OK"

Phase 3: Host-Side Configuration

Step 11: Rescan for New Storage on the Host

* The host needs to be made aware of the newly provisioned storage. The exact process for this depends on the host's operating system:

* Windows:

* OpenDisk Management(diskmgmt.msc).

* Go toAction > Rescan Disks.

* Linux:

* Identify the SCSI host bus numbers (e.g., ls /sys/class/scsi_host).

* Use the command echo "- - -" > /sys/class/scsi_host/hostX/scan, replacing hostX with the appropriate host bus number.

* You might also be able to use tools like rescan-scsi-bus.sh.

* VMware ESXi:
* In the vSphere Client, select the host.
* Go toConfigure > Storage Adapters.
* Select the relevant storage adapter (e.g., your HBA).
* ClickRescan Storage.
Step 12: Initialize, Partition and Mount (if needed):
* Once the host detects the new volumes, you'll need to initialize them, create partitions, format them with a filesystem, and mount them, depending on your operating system and how you intend to use the storage. This is done using the host's operating system tools.
Phase 4: Verification and Monitoring
Step 13: Verify in Unisphere
* Go back to the storage group in Unisphere and check the "Volumes" tab. You should see the three new
100 GB volumes listed along with the original two, and they should all have the "Platinum" service level.
Step 14: Verify on the Host
* Confirm that the host can see and access the new volumes.
Step 15: Monitor Performance
* After making these changes, monitor the performance of the storage group and the application using Unisphere's performance monitoring tools. Ensure that the Platinum service level is meeting your application's requirements

NEW QUESTION # 139
Which units of measure are used to specify the size type when creating volumes in Unisphere?

- A. MB, TB, PB
- B. Cylinders, GB, TB. PB
- C. MB and GB only
- D. Cylinders, MB, GB, TB

Answer: B

NEW QUESTION # 140
What is the functionality of the storstpd Solutions Enabler daemon?

- A. Starts the system watchdog timer periodically
- B. Performs remote Solutions Enabler API functions.
- C. Coordinates storage array locks and application syscalls
- D. Collects and manages performance statistics.

Answer: D

Explanation:
Step by Step Comprehensive Detailed Explanation:
Solutions Enabler (SE) uses various daemons (background processes) to perform different functions. The storstpd daemon is specifically responsible for:
* Collecting Performance Statistics:It gathers performance data from the connected storage arrays, such as I/O rates, response times, and other metrics.
* Managing Performance Data:It stores and manages the collected performance statistics, making them available for monitoring and analysis through tools like Unisphere for PowerMax.
This data is crucial for understanding the performance of the storage arrays, identifying potential bottlenecks, and optimizing storage resources.
Why other options are incorrect:
* B. Coordinates storage array locks and application syscalls:This is the function of the storapid daemon.
* C. Starts the system watchdog timer periodically:This is not directly related to the storstpd daemon.
* D. Performs remote Solutions Enabler API functions:This is typically handled by the storsrvd daemon.
References and documents of Dell's public documentation for PowerMax Operate v.2:
* Dell Solutions Enabler 10.0.0 CLI User Guide:This guide provides information about the different daemons used by Solutions Enabler and their roles. You can find this document on the Dell Support website by searching for "Solutions Enabler CLI User Guide."

NEW QUESTION # 141

What does the symsan command do when scanning the SAN environment for devices to use in an O-MDM session?

- A. Temporarily stops the remote application to verify the SAN configuration
- B. Verifies the SAN configuration and creates and ORS session on the remote host
- C. Temporarily stops the remote application and creates an ORS session
- D. Verifies the SAN configuration without disruption to the remote host

Answer: D

Explanation:
Step by Step Comprehensive Detailed Explanation:
The symsan command in Solutions Enabler is used for various SAN (Storage Area Network) management tasks. One of its functions is to scan the SAN environment to discover and verify the configuration of devices and paths.
When used in the context of an Open Replicator Migrator for Dell EMC (O-MDM) session, the symsan command specifically:
* Verifies SAN Configuration:It checks the connectivity and configuration of the SAN fabric to ensure that the source and target devices are accessible and properly configured for the migration.
* Non-Disruptive:It performs this verification without disrupting any applications or host I/O operations on the remote host. This is crucial for maintaining business continuity during the migration planning phase.
Why other options are incorrect:
* A. Temporarily stops the remote application to verify the SAN configuration:symsan does not stop applications; it performs a non-disruptive scan.
* B. Verifies the SAN configuration and creates an ORS session on the remote host:symsan only verifies the SAN; it doesn't create ORS (Open Replicator Solutions) sessions.
* D. Temporarily stops the remote application and creates an ORS session:Again, symsan doesn't stop applications or create ORS sessions.
References and documents of Dell's public documentation for PowerMax Operate v.2:
* Dell Solutions Enabler 10.0.0 CLI User Guide:This guide provides detailed information about the symsan command and its various options, including its use for SAN discovery and verification. You can find this document on the Dell Support website by searching for "Solutions Enabler CLI User Guide."
* Dell PowerMax Family: Essentials and Best Practices Guide:This guide may offer general information about SAN management and migration tools, providing context for understanding the role of the symsan command.

NEW QUESTION # 142

What is the largest TDEV PowerMaxOS 5978 can create?

- A. 64TB
- B. 256TB
- C. 128 TB
- D. 32 TB

Answer: A

Explanation:
Step by Step Comprehensive Detailed Explanation:
In PowerMaxOS 5978, the largest TDEV (Thin Device) that can be created is64TB. This represents the maximum size for a single, thinly provisioned storage volume on a PowerMax array running that version of the operating system.
References and documents of Dell's public documentation for PowerMax Operate v.2:
* Dell PowerMax Family: Essentials and Best Practices Guide:This guide provides an overview of PowerMax features and capabilities, including information about storage device sizes and limits.
* Dell Solutions Enabler 10.0.0 CLI User Guide:This guide might contain details about the maximum size of TDEVs that can be created using SYMCLI commands.
