COF-C02最新考證 & COF-C02考試備考經驗

近來，Snowflake的認證考試越來越受大家的歡迎。Snowflake的認證資格也變得越來越重要。作為被 IT行業廣泛認可的考試，COF-C02認證考試是Snowflake中最重要的考試之一。取得了這個考試的認證資格，你就可以獲得很多的利益。如果你也想參加這個考試的話，VCESoft的COF-C02考古題是你準備考試的時候不能缺少的工具。因為這是COF-C02考試的最優秀的參考資料。

SnowPro Core認證考試是一個基於電腦的考試，由90個多選題組成。考試有時間限制，持續時間為2小時。候選人必須達到至少80%的分數才能通過考試並獲得認證。考試提供多種語言版本，可以在全球任何地方網上參加。

最新的 SnowPro Core COF-C02 免費考試真題 (Q580-Q585):

問題 #580

Which schema-level objects allow the user to periodically perform an action under specific conditions, based on data within Snowflake?

- **A. Alerts**
- B. Secure views
- C. Materialized views
- D. External tables

答案: A

解題說明:

* Alerts in Snowflake are schema-level objects that allow users to define conditions and actions to be performed automatically when those conditions are met.

* Alerts use a schedule to periodically evaluate a query result and take action if the condition evaluates to TRUE.

Example:

```
CREATE ALERT my_alert
IF (SELECT COUNT(*) FROM my_table WHERE status = 'ERROR') > 0
SCHEDULE = '5 MINUTE'
ACTION = CALL notify_error_procedure();
```

Why Other Options Are Incorrect:

* B. External tables: Used to query external data but cannot trigger actions.

* C. Secure views: Ensure data privacy but do not perform actions.

* D. Materialized views: Improve performance by precomputing query results but do not perform periodic actions.

* Snowflake Alerts Documentation

問題 #581

In the query profiler view for a query, which components represent areas that can be used to help optimize query performance? (Select TWO)

- A. Bytes sent over the network
- B. External bytes scanned
- C. Percentage scanned from cache
- **D. Bytes scanned**
- **E. Number of partitions scanned**

答案: D,E

問題 #582

When floating-point number columns are unloaded to CSV or JSON files, Snowflake truncates the values to approximately what?

- A. (10,4)
- B. (14,8)
- C. (12,2)
- **D. (15,9)**

答案: D

解題說明:

When unloading floating-point number columns to CSV or JSON files, Snowflake truncates the values to approximately 15 significant digits with 9 digits following the decimal point, which can be represented as (15,9). This ensures a balance between accuracy and efficiency in representing floating-point numbers in text-based formats, which is essential for data interchange and processing applications that consume these files.

問題 #583

True or false: Snowflake enforces unique, primary key, and foreign key constraints during DML operations.

- A. True
- B. False

答案: B

問題 #584

How does the Access_History view enhance overall data governance pertaining to read and write operations? (Select TWO).

- A. Determines whether a given row in a table can be accessed by the user by filtering the data based on a given policy
- B. Shows how the accessed data was moved from the source to the target objects
- C. Identifies columns with personal information and tags them so masking policies can be applied to protect sensitive data
- D. Protects sensitive data from unauthorized access while allowing authorized users to access it at query runtime
- E. Provides a unified picture of what data was accessed and when it was accessed

答案: A,E

解題說明:

The ACCESS_HISTORY view in Snowflake is a powerful tool for enhancing data governance, especially concerning monitoring and auditing data access patterns for both read and write operations. The key ways in which ACCESS_HISTORY enhances overall data governance are:

B. Provides a unified picture of what data was accessed and when it was accessed: This view logs details about query executions, including the objects (tables, views) accessed and the timestamps of these accesses. It's instrumental in auditing and compliance scenarios, where understanding the access patterns to sensitive data is critical.

E. Determines whether a given row in a table can be accessed by the user by filtering the data based on a given policy: While this option is a bit of a misinterpretation of what ACCESS_HISTORY directly offers, it indirectly supports data governance by providing the information necessary to analyze access patterns. This analysis can then inform policy decisions, such as implementing Row-Level Security (RLS) to restrict access to specific rows based on user roles or attributes.

ACCESS_HISTORY does not automatically apply data masking or tag columns with personal information. However, the insights derived from analyzing ACCESS_HISTORY can be used to identify sensitive data and inform the application of masking policies or other security measures.
