NEW QUESTION # 157

Which goal would be important in undertaking a Consequence Scanning exercise before launching a new product?

- A. Encourage team well-being through collaboration.
- **B. Reframe the product objectives from multiple, diverse perspectives.**
- C. Identify the best angle for positive launch press coverage.

**Answer: B**

Explanation:

Consequence scanning is a practice that helps teams to consider the potential consequences of their product or service on people, communities, and the planet<sup>1</sup>. It is an agile tool that fits within an iterative development cycle and allows teams to identify and mitigate risks, as well as focus on positive outcomes<sup>2</sup>. One of the goals of consequence scanning is to reframe the product objectives from multiple, diverse perspectives. This means that the team can explore how different stakeholders, such as users, organisations, or society, might be affected by the product or service, both intentionally and unintentionally<sup>2</sup>. By doing so, the team can ensure that the product or service aligns with their values and culture, and that they are aware of the trade-offs and implications of their decisions<sup>2</sup>. Reframing the product objectives from multiple, diverse perspectives can also help the team to discover new opportunities, generate innovative solutions, and increase user satisfaction and trust<sup>3</sup>.

Encouraging team well-being through collaboration and identifying the best angle for positive launch press coverage are not the primary goals of consequence scanning, although they might be beneficial side effects. Consequence scanning is not a PR exercise, but a way to ensure responsible innovation and ethical design<sup>2</sup>. While consequence scanning can foster team collaboration and communication, it is not a team-building activity, but a way to share knowledge and expertise and raise concerns in a dedicated format<sup>2</sup>. #### NEW QUESTION # 158

Cloud Kicks wants its Salesforce app to represent company branding and comply with Web Content Accessibility Guidelines (WCAG) 2.1.

What should they consider about themes and branding?

- **A. The color palette is auto-generated based on the brand color to be WCAG compliant.**
- B. There is a default WCAG complaint Salesforce color theme; only brand color can be updated.
- C. Salesforce automatically updates the selected brand color to make it accessible; this should overridden to select the colors manually.

**Answer: A**

Explanation:

Themes and branding allow Salesforce app developers to customize the look and feel of their apps to match their company's branding and accessibility standards. One of the features of themes and branding is the ability to select a brand color, which is the primary color used for buttons, links, and highlights. Salesforce automatically generates a color palette based on the brand color, which includes accessible colors that meet the WCAG 2.1 contrast ratio guidelines. This ensures that the app is visually appealing and accessible to users with different color vision abilities. Developers can also customize other aspects of the theme, such as the logo, page background, and default font. [Themes and Branding Basics], [Accessibility in Salesforce]

#### NEW QUESTION # 159

Cloud Kicks wants to plan out the strategy for an upcoming discovery phase.

Which three practices should be considered?

Choose 3 answers

- **A. Establish the research plan and timeline.**
- **B. Understand the problem before moving to solutions.**
- **C. Gather insight from end users.**
- D. Determine user acceptance criteria.
- E. Consider platform-based before custom solutions.

**Answer: A,B,C**

Explanation:

The discovery phase is a crucial stage in any UX design project, as it helps to understand the user needs, business goals, and technical constraints of the problem. The discovery phase typically involves various research methods, such as interviews, surveys, observations, and analytics, to gather data and insights about the users and the context of use. The outputs of the discovery phase are artifacts that synthesize and communicate the findings and insights from the research. Some of the practices that should be considered for planning out the strategy for an upcoming discovery phase are:

**Gather insight from end users:** One of the main objectives of the discovery phase is to empathize with the end users and understand their goals, motivations, pain points, behaviors, and preferences. This can be done by conducting user research, such as interviews, surveys, focus groups, or usability tests, to collect qualitative and quantitative data from the target audience. Gathering insight from end users helps to validate the assumptions and hypotheses about the problem and the solution, as well as to identify the user requirements and expectations for the design.

**Establish the research plan and timeline:** Before conducting any user research, it is important to establish a clear and realistic research plan and timeline. The research plan should define the research objectives, questions, methods, participants, and deliverables. The research timeline should specify the duration, frequency, and sequence of the research activities, as well as the deadlines and milestones for the deliverables. Establishing the research plan and timeline helps to ensure that the discovery phase is well-organized, efficient, and effective, as well as to communicate the expectations and responsibilities to the stakeholders and the team members.

**Understand the problem before moving to solutions:** Another key practice for the discovery phase is to focus on understanding the problem before jumping to solutions. This means defining the problem statement, the scope, and the constraints of the project, as well as identifying the root causes, the symptoms, and the impacts of the problem. Understanding the problem before moving to solutions helps to avoid wasting time and resources on creating solutions that do not address the real needs and pain points of the users, or that are not feasible or viable for the business or the technology.

The other two options, considering platform-based before custom solutions and determining user acceptance criteria, are not practices that should be considered for planning out the strategy for an upcoming discovery phase. Considering platform-based before custom solutions is a practice that belongs to the design phase, not the discovery phase, as it involves choosing the best solution option based on the user research findings and the design principles. Determining user acceptance criteria is a practice that belongs to the testing phase, not the discovery phase, as it involves defining the criteria that the solution must meet to be accepted by the users and the stakeholders.

For Cloud Kicks' upcoming discovery phase, the three practices that should be considered are:

A) **Understand the Problem Before Moving to Solutions:** Establishing a clear understanding of the problem and what the desired outcomes are before beginning the discovery phase is essential for successful project planning. This can be done by gathering data and insights from end users, conducting research, and understanding how the problem is currently being addressed.

B) **Gather Insight from End Users:** Gathering insights from end users is a crucial step in the discovery phase. End users provide valuable feedback and insights into the problem and how a potential solution may work. This feedback can help shape the overall project plan and help identify potential solutions.

C) **Establish the Research Plan and Timeline:** The research plan and timeline should be established before beginning the discovery phase. This should include a list of tasks to be completed, the resources needed, and a timeline for completion. This plan should be communicated to all stakeholders so everyone is aware of the project goals and timeline.

### NEW QUESTION # 160

A UX Designer creates a set of patterns and guidelines for including visual indicators letting a user know which form fields are required.

Which Usability Heuristic is being used in this case?

- A. User Control and Freedom
- B. Error diagnosis and recovery
- C. **Visibility of system status**

**Answer: C**

Explanation:

Visibility of system status is the usability heuristic that is being used in this case. Visibility of system status means that the system should always keep users informed about what is going on, through appropriate feedback within reasonable time. One way to apply this heuristic is to use visual indicators to let users know which form fields are required, such as asterisks, labels, or colors. This helps users to understand the expectations and requirements of the system, and to avoid errors or confusion. By providing clear and timely feedback, the system enhances the user experience and satisfaction.
