

C-ABAPD-2507 Latest Test Discount Free PDF | Latest Latest C-ABAPD-2507 Exam Objectives: SAP Certified Associate - Back-End Developer - ABAP Cloud

P.S. Free 2026 SAP C-ABAPD-2507 dumps are available on Google Drive shared by SurePassExams:
<https://drive.google.com/open?id=1S6zPAdnWD5BIFT7gca9VENvojYgittLF>

SurePassExams wants to win the trust of SAP C-ABAPD-2507 exam candidates at any cost. To achieve this objective SurePassExams is offering some top features with C-ABAPD-2507 exam practice questions. These prominent features hold high demand and are specifically designed for quick and complete C-ABAPD-2507 Exam Questions preparation.

SAP C-ABAPD-2507 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> ABAP SQL and Code Pushdown: This section of the exam measures skills of SAP ABAP Developers and covers the use of advanced SQL techniques within ABAP. It includes code pushdown strategies that leverage database-level processing to enhance application performance. Key areas include Open SQL enhancements and integrating logic closer to the database.
Topic 2	<ul style="list-style-type: none"> Object-Oriented Design: This section of the exam measures skills of SAP ABAP Developers and covers the basics of object-oriented programming in ABAP. It includes concepts such as classes, interfaces, inheritance, polymorphism, and encapsulation, all of which are necessary for building robust and scalable ABAP applications.
Topic 3	<ul style="list-style-type: none"> ABAP RESTful Application Programming Model: This section of the exam measures skills of SAP Application Programmers and covers the fundamentals of the ABAP RESTful Application Programming Model (RAP). It includes topics such as behavior definitions, service binding, and the use of managed and unmanaged scenarios. The focus is on building modern, scalable, and cloud-ready applications using RAP.
Topic 4	<ul style="list-style-type: none"> SAP Clean Core Extensibility and ABAP Cloud: This section of the exam measures skills of SAP Application Programmers and covers the clean core principles and extensibility options within SAP BTP. It also includes cloud-native ABAP development practices, emphasizing the creation of upgrade-stable and maintainable extensions aligned with SAP's cloud strategy.

Fast Download SAP C-ABAPD-2507: SAP Certified Associate - Back-End Developer - ABAP Cloud Latest Test Discount - High-quality SurePassExams Latest C-ABAPD-2507 Exam Objectives

We will offer the preparation for the C-ABAPD-2507 training materials, we will also provide you the guide in the process of using. The materials of the exam dumps offer you enough practice for the C-ABAPD-2507 as well as the knowledge points of the C-ABAPD-2507 exam, the exam will become easier. If you are interested in the C-ABAPD-2507 training materials, free demo is offered, you can have a try. And the downloading link will send to you within ten minutes, so you can start your preparation as quickly as possible. In fact, the outcome of the C-ABAPD-2507 Exam most depends on the preparation for the C-ABAPD-2507 training materials. With the training materials, you can make it.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q60-Q65):

NEW QUESTION # 60

When you work with a test class you can set up some prerequisites before the actual testing.

In which sequence will the following fixtures be called by the test environment?

teardown()

class_setup()

class_teardown()

setup()

- A. setup()
- B. class_setup()
- C. class_teardown()
- D. teardown()

Answer: A,B,C,D

NEW QUESTION # 61

Setting a field to read-only in which object would make the field read-only in all applications of the RESTful Application Programming model?

- A. Service definition
- **B. Behaviour definition**
- C. Projection view
- D. Metadata extension

Answer: B

Explanation:

The object that can be used to set a field to read-only in all applications of the RESTful Application Programming model (RAP) is the behaviour definition. The behaviour definition is a CDS artefact that defines the business logic and the UI behaviour of a business object. A business object is a CDS entity that represents a business entity or concept, such as a customer, an order, or a product. The behaviour definition can specify the properties of the fields of a business object, such as whether they are mandatory, read-only, or transient. These properties are valid for all applications that use the business object, such as transactional, analytical, or draft-enabled apps¹². For example:

The following code snippet defines a behaviour definition for a business object ZI_PB_APPLICATION. It sets the field APPLICATION to read-only for all applications that use this business object:

```
define behavior for ZI_PB_APPLICATION { field ( read only ) APPLICATION; ... }
```

You cannot do any of the following:

A . Service definition: A service definition is a CDS artefact that defines the interface and the binding of a service. A service is a CDS entity that exposes the data and the functionality of one or more business objects as OData, InA, or SQL services. A service definition can specify the properties of the fields of a service, such as whether they are filterable, sortable, or aggregatable. However, these properties are only valid for the specific service that uses the business object, not for all applications that use the business object¹².

C . Projection view: A projection view is a CDS artefact that defines a view on one or more data sources, such as tables, views, or associations. A projection view can select, rename, or aggregate the fields of the data sources, but it cannot change the properties of the fields, such as whether they are read-only or not. The properties of the fields are inherited from the data sources or the behaviour definitions of the business objects¹².

D . Metadata extension: A metadata extension is a CDS artefact that defines additional annotations for a CDS entity, such as a business object, a service, or a projection view. A metadata extension can specify the properties of the fields of a CDS entity for UI or analytical purposes, such as whether they are visible, editable, or hidden. However, these properties are only valid for the specific UI or analytical application that uses the metadata extension, not for all applications that use the CDS entity¹².

NEW QUESTION # 62

When defining a METHOD, which parameter type can only have 1 value?

- A. EXPORTING
- B. IMPORTING
- **C. RETURNING**
- D. CHANGING

Answer: C

NEW QUESTION # 63

Given the following data definitions:

```
DATA: text TYPE string VALUE 'Date 1972-04-01 is in ISO format'.
```

```
DATA: regex TYPE string VALUE '[0-9]{4}(-[0-9]{2}){2}'.
```

In which of the following functions can you use regular expressions?

(Select 3 correct answers)

- **A. find(val = text pcre = regex)**
- **B. matches(val = text pcre = regex)**
- C. reverse(val = text pcre = regex)
- D. condense(val = text pcre = regex)
- **E. match(val = text pcre = regex)**

Answer: A,B,E

Explanation:

Comprehensive and Detailed Explanation from Exact Extract:

In ABAP Cloud, string functions that support regular expressions (PCRE) include:

- * `match()` # returns the first substring matching the regex.
- * `matches()` # checks if the whole string matches the regex.
- * `find()` # finds a substring based on regex pattern.

Functions such as `reverse()` and `condense()` do not support regex patterns; they are purely string manipulation utilities.

Verified Study Guide Reference: ABAP Keyword Documentation - String Functions with Regular Expressions.

NEW QUESTION # 64

In class `ZCL_CLASS_A`, you use the statement `DATA var TYPE ***`

What may stand in place of `***`? Note: There are 2 correct answers to this question.

- A. The name of a domain from the ABAP Dictionary
- B. The name of a data element from the ABAP Dictionary
- C. The name of a type defined privately in another class
- D. The name of a type defined privately in class `ZCL_CLASS_A`

Answer: A,B

Explanation:

In class `ZCL_CLASS_A`, you use the statement `DATA var TYPE ***` to declare a data object named `var` with a data type specified by `***`. The data type can be any of the following1:

A predefined ABAP type, such as `i`, `f`, `c`, `string`, `xstring`, and so on.

A data element from the ABAP Dictionary, such as `matnr`, `carriid`, `bukrs`, and so on. A data element defines the semantic and technical attributes of a data field, such as the domain, the length, the data type, the description, and the value range2.

A domain from the ABAP Dictionary, such as `matnr_d`, `carriid_d`, `bukrs_d`, and so on. A domain defines the technical attributes of a data field, such as the data type, the length, the output length, the number of decimal places, and the value range3.

A type defined globally in a class, an interface, or a type pool, such as `zcl_class_b=>type_a`, `zif_interface_c=>type_b`, `ztype_pool_d=>type_c`, and so on. A global type is a type that is defined in a global repository object and can be used in any program or class4.

A type defined locally in the current class, such as `type_a`, `type_b`, `type_c`, and so on. A local type is a type that is defined in the declaration part of a class and can only be used within the class5.

Therefore, the possible values for `***` are B. the name of a data element from the ABAP Dictionary and D. the name of a domain from the ABAP Dictionary. The other options are not valid because:

A. The name of a type defined privately in class `ZCL_CLASS_A` is a local type and cannot be used with the `DATA` statement. A local type can only be used with the `TYPES` statement5.

C. The name of a type defined privately in another class is a private type and cannot be accessed from outside the class. A private type can only be used within the class that defines it.

NEW QUESTION # 65
