Why Do You Need to Trust on {ISTQB} ISTQB CT-PT Exam Questions?

Our professional experts have carefully compiled our CT-PT practice braindumps to be the best seller in the market. The information is provided in the form of our CT-PT exam questions and answers, following the style of the real exam paper pattern. So if you buy our CT-PT training guide, you will find that it is easy to pass the exam for it is exam-oriented. What is more, you will learn a lot of work skills according to the latest information.

ISTQB Certified Tester - Performance Testing Sample Questions (Q34-Q39):

NEW QUESTION # 34
What should be captured for batch processing performance metrics?

- A. Average percentage of network latency
- B. Number of records deleted
- C. Number of concurrent virtual users
- D. Throughput and wait times

Answer: D

Explanation:
For batch processing performance metrics, the two most important factors are:
Throughput - Measures the number of transactions processed over time.
Wait times - Evaluates delays in processing batches.
Option B (Number of records deleted) is irrelevant unless batch processing specifically involves deletions.
Option C (Network latency percentage) applies to real-time transaction processing, not batch jobs.
Option D (Concurrent virtual users) applies more to load testing rather than batch performance.

NEW QUESTION # 35

Which of the following is the most economical solution to minimize costs and time for performance testing for a high-end production client-server platform?

- A. Mainframe environment
- B. Isolated lab environment
- C. No environment
- D. Cloud-based environment

Answer: D

Explanation:
A cloud-based environment is the most cost-effective solution for performance testing. It offers scalability, pay-per-use models, and flexibility, allowing testers to simulate large workloads without expensive infrastructure investments.
Option A (Isolated lab environment) is costly due to hardware maintenance and infrastructure costs.
Option C (Mainframe environment) is expensive and impractical for performance testing.
Option D (No environment) is not a viable option.

NEW QUESTION # 36

You are managing a project that is testing a system that manages a newly redesigned jet engine for heavy aircraft. Given the fact that this engine is specifically engineered to reduce noise, it is important that the software maintains enough thrust for lift for a period of 5 minutes without exceeding 87.5dB. The software must achieve this independent of other internal systems such as fuel or navigation management.
Given the risk for the ability of the aircraft to meet the noise abatement regulations while still being able to fly, when is the optimum time in the software lifecycle to apply the performance testing?

- A. Preferably at the end of unit testing
- B. Preferably during each phase in the lifecycle
- C. Preferably at the end of system testing
- D. Preferably during system integration testing

Answer: B

Explanation:
Performance testing should be integrated into every phase of the software lifecycle to ensure that critical performance requirements (such as thrust-to-noise ratio) are met early and continuously validated.
Option B (End of system testing) is too late, as issues may be costly to fix at that stage.
Option C (During system integration testing) is useful but not comprehensive enough.
Option D (At the end of unit testing) is incorrect because unit tests do not assess overall system performance.

NEW QUESTION # 37

Which of the following is a static performance test?

- A. Evaluation of the test execution skills of the testers
- B. Usability test of the user interface
- C. Review of the network architecture
- D. Formal signature approval by the end users

Answer: C

Explanation:
A static performance test is a non-execution-based review that analyzes system architecture, network configurations, and other elements that affect system performance before execution.
Option A (Usability test) is not a static performance test but rather a functional or UX evaluation.
Option B (Evaluation of testers' skills) is unrelated to performance testing.
Option D (Formal signature approval) is an administrative task and not a static test.

NEW QUESTION # 38
Which of the following is considered a characteristic of stress testing?

- A. It focuses on the system's ability to handle transactions over a specific timeframe.
- B. Considers the system's ability to recover from a sudden increase of loads within the system's limits.
- C. It evaluates the system's ability to handle loads beyond its design limits.
- D. It determines the maximum number of transactions a system can handle.

Answer: C

Explanation:
Stress testing is designed to evaluate how a system behaves under extreme conditions, often exceeding its design limitations. The goal is to identify bottlenecks, memory leaks, and failures that occur beyond normal operating conditions.
Option A is incorrect because it refers to resilience testing, which focuses on recovery rather than stress beyond limits.
Option B is incorrect as it describes load testing, which measures performance under expected loads.
Option C is incorrect since determining the maximum transactions is a feature of capacity testing, not stress testing.

NEW QUESTION # 39
......

The most interesting thing about the learning platform is not the number of questions, not the price, but the accurate analysis of each year's exam questions. Our CT-PT guide dump through the analysis of each subject research, found that there are a lot of hidden rules worth exploring, this is very necessary, at the same time, our CT-PT training materials have a super dream team of experts, so you can strictly control the proposition trend every year. In the annual examination questions, our CT-PT study questions have the corresponding rules to summarize, and can accurately predict this year's test hot spot and the proposition direction. This allows the user to prepare for the test full of confidence.
