Reliable AZ-305 Test Online | Reliable Test AZ-305 Test

By focusing on how to help you more effectively, we encourage exam candidates to buy our AZ-305 study braindumps with high passing rate up to 98 to 100 percent all these years. Our experts designed three versions for you rather than simply congregate points of questions into AZ-305 Real Questions. Efforts conducted in an effort to relieve you of any losses or stress. So our activities are not just about profitable transactions to occur but enable exam candidates win this exam with the least time and get the most useful contents.

Microsoft AZ-305 exam is intended for those who already have a strong foundation in Azure infrastructure and are looking to expand their knowledge and skills. It is also ideal for IT professionals who are responsible for designing, implementing, and managing Azure solutions. Passing AZ-305 exam proves that you have the necessary knowledge and skills to design and implement Azure solutions that are secure, scalable, and highly available. Designing Microsoft Azure Infrastructure Solutions certification will help you stand out in the job market and demonstrate your expertise to employers. With the increasing demand for cloud computing skills, the Microsoft AZ-305 Exam is an excellent way to boost your career prospects in the IT industry.

Microsoft Designing Microsoft Azure Infrastructure Solutions Sample Questions (Q251-Q256):

NEW QUESTION # 251

Your company has two on-premises sites in New York and Los Angeles and Azure virtual networks in the East US Azure region and the West US Azure region. Each on-premises site has Azure ExpressRoute circuits to both regions.

You need to recommend a solution that meets the following requirements:

Outbound traffic to the Internet from workloads hosted on the virtual networks must be routed through the closest available on-premises site.

If an on-premises site fails, traffic from the workloads on the virtual networks to the Internet must reroute automatically to the other site.

What should you include in the recommendation? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

NEW QUESTION # 252

You have an Azure subscription. The subscription contains an app that is hosted in the East US, Central Europe, and East Asia regions.

You need to recommend a data-tier solution for the app. The solution must meet the following requirements:

- * Support multiple consistency levels.
- * Be able to store at least 1 TB of data.
- * Be able to perform read and write operations in the Azure region that is local to the app instance.

What should you include in the recommendation?

- **A. an Azure Cosmos DB database**
- B. Azure Table storage that uses geo-redundant storage (GRS) replication
- C. an Azure SQL database in an elastic pool
- D. a Microsoft SQL Server Always On availability group on Azure virtual machines

Answer: A

Explanation:

Explanation

Azure Cosmos DB approaches data consistency as a spectrum of choices. This approach includes more options than the two extremes of strong and eventual consistency. You can choose from five well-defined levels on the consistency spectrum.

With Cosmos DB any write into any region must be replicated and committed to all configured regions within the account.

Reference:

<https://docs.microsoft.com/en-us/azure/cosmos-db/consistency-levels-tradeoffs>

NEW QUESTION # 253

You have an Azure web app named App1 and an Azure key vault named KV1.

App1 stores database connection strings in KV1.

App1 performs the following types of requests to KV1:

Get

List

Wrap

Delete

Unwrap

Backup

Decrypt

Encrypt

You are evaluating the continuity of service for App1.

You need to identify the following if the Azure region that hosts KV1 becomes unavailable:

To where will KV1 fail over?

During the failover, which request type will be unavailable?

What should you identify? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Reference:

<https://docs.microsoft.com/en-us/azure/key-vault/general/disaster-recovery-guidance>

NEW QUESTION # 254

You have an Azure subscription that contains a virtual network named VNET1 and 10 virtual machines. The virtual machines are connected to VNET1.

You need to design a solution to manage the virtual machines from the internet. The solution must meet the following requirements:

- * Incoming connections to the virtual machines must be authenticated by using Azure Multi-Factor Authentication (MFA) before network connectivity is allowed.

- * Incoming connections must use TLS and connect to TCP port 443.

- * The solution must support RDP and SSH.

What should you include in the solution? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

NEW QUESTION # 255

You manage a database environment for a Microsoft Volume Licensing customer named Contoso, Ltd.

Contoso uses License Mobility through Software Assurance.

You need to deploy 50 databases. The solution must meet the following requirements:

- * Support automatic scaling.

- * Minimize Microsoft SQL Server licensing costs.

What should you include in the solution? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

Box 1: vCore

Virtual core (vCore)-based purchasing model (recommended). This purchasing model provides a choice between a provisioned compute tier and a serverless compute tier. With the provisioned compute tier, you choose the exact amount of compute resources that are always provisioned for your workload. With the serverless compute tier, you specify the autoscaling of the compute resources over a configurable compute range. Box 2: An Azure SQL Database Elastic pool. Azure SQL Database provides the following deployment options for a database:

- * Single database represents a fully managed, isolated database.

- * Elastic pool is a collection of single databases with a shared set of resources, such as CPU or memory.

Single databases can be moved into and out of an elastic pool.
