- A. False
- B. True

Answer: B

NEW QUESTION # 18

VXLAN is essentially a VPN technology and can be used to build a Layer 2 virtual network over any network with reachable routes. VXLAN uses VXLAN gateways to enable communication within a VXLAN network and between a VXLAN network and a non-VXLAN network.

- A. FALSE
- B. TRUE

Answer: B

Explanation:

Huawei defines VXLAN (Virtual Extensible LAN) as an overlay virtualization technology that functions similarly to a Layer 2 VPN, enabling the extension of Layer 2 networks across Layer 3 infrastructures.

VXLAN encapsulates Ethernet frames within UDP packets, allowing tenants to build isolated virtual networks over any IP underlay with reachable routing.

The statement is correct because VXLAN enables Layer 2 adjacency across geographically distributed data centers, which is a key requirement in cloud and virtualization environments. It supports large-scale multi-tenant isolation using VNIs (VXLAN Network Identifiers), significantly exceeding VLAN limitations.

Additionally, VXLAN gateways (either centralized or distributed) play a crucial role. They provide communication:

Within VXLAN networks (intra-subnet and inter-subnet via distributed gateways) Between VXLAN and traditional networks (e.g.,

bare-metal servers or legacy VLAN-based systems) Huawei CloudFabric solutions heavily rely on VXLAN with BGP EVPN control plane to achieve scalable, automated, and efficient data center networking. Therefore, the statement is TRUE .
