## Oracle Cloud Infrastructure 2025 Developer Professional Sample Questions (Q88-Q93):

### NEW QUESTION # 88

Which of these is a valid use case for OCI Queue?

- A. Storing and retrieving large files
- **B. Building decoupled and scalable systems**
- C. Sending real-time streaming data
- D. Managing network traffic between services

**Answer: B**

Explanation:

OCI Queue is a fully managed serverless service that helps decouple systems and enable asynchronous operations. Queue handles high-volume transactional data that requires independently processed messages without loss or duplication. A valid use case for OCI Queue is building decoupled and scalable systems, such as event-driven architectures or microservices-based applications.

For example, you can use Queue to decouple your application and build an event-driven architecture. Decoupling ensures that individual application components can scale independently and that you can future-proof your design so that as new application components are built, they can publish or subscribe to the queue2.

#### NEW QUESTION # 89

Which two "Action Type" options are NOT available in an Oracle Cloud Infrastructure (OCI) Events rule definition? (Choose two.)

- A. Slack
- B. Notifications
- C. Streaming
- D. Email
- E. Functions

**Answer: A,D**

Explanation:

The two "Action Type" options that are NOT available in an Oracle Cloud Infrastructure (OCI) Events rule definition are: Email (Correct) Slack (Correct) The available "Action Type" options in OCI Events rule definition include Functions, Notifications, and Streaming. However, email and Slack are not directly supported as action types in OCI Events. Instead, you can use Notifications to send notifications to various notification channels, including email and Slack, through the OCI Notifications service.

#### NEW QUESTION # 90

Which testing strategy achieves high velocity of deployments and releases of cloud native applications? (Choose the best answer.)

- A. Integration testing
- B. A/B testing
- C. Automated testing
- D. Penetration testing

**Answer: C**

Explanation:

The testing strategy that achieves high velocity of deployments and releases of cloud native applications is "Automated testing." Automated testing involves the use of automated tools and frameworks to execute tests, validate functionality, and detect issues or bugs in an application. By automating the testing process, developers and DevOps teams can rapidly test and validate code changes, ensuring that new features and updates are functioning correctly before being deployed to production. This approach helps increase the speed and efficiency of the testing process, allowing for faster and more frequent deployments of cloud native applications.

#### NEW QUESTION # 91

To effectively test your cloud native applications for "unknown unknowns", you need to employ various testing and deployment strategies. Which strategy involves exposing new functionality or features to only a small set of users?

- A. Blue/Green Deployment
- B. A/B Testing
- C. Canary Deployment
- D. Component Testing

**Answer: C**

Explanation:

The strategy that involves exposing new functionality or features to only a small set of users is called Canary Deployment. Canary deployment is a technique used in software development and deployment where a new version of an application or feature is released to a small subset of users or a specific group of servers. This allows for testing and gathering feedback on the new functionality in a controlled and limited environment before making it available to a wider audience. In a canary deployment, a small portion of the traffic is routed to the new version while the majority of the traffic still goes to the stable version. This allows for monitoring and evaluation of the new functionality in real-world conditions while minimizing the impact of any potential issues or bugs. If the new version performs well and meets the desired criteria, it can then be gradually rolled out to a larger user base or all servers. By exposing the new functionality or features to a small set of users initially, canary deployment helps in identifying any unforeseen

issues, gathering feedback, and ensuring the stability and reliability of the application before a full deployment.

### NEW QUESTION # 92

From a DevOps process standpoint, it is a good practice to keep changes to an application under version control. Which of the following allows changes to a Docker image to be stored in a version control system?

- A. Updating docker-compose.yml
- **B. Executing docker commit**
- C. Updating Dockerfile
- D. Executing docker save

**Answer: B**

Explanation:

The option that allows changes to a Docker image to be stored in a version control system is: docker commit The docker commit command is used to create a new image from a container's changes. It takes a running container as input, captures the changes made to it, and creates a new image with those changes. This new image can then be tagged and pushed to a registry, or saved locally. By using docker commit, you can effectively capture the changes made to a container as a new image and store it in a version control system along with the Dockerfile and other project files. This allows for reproducibility and traceability of changes to the Docker image over time.
