Cisco Designing Cisco Security Infrastructure Sample Questions (Q71-Q76):

NEW QUESTION # 71
A developer is building new API functions for a cloud-based application. Before writing the code, the developer wants to ensure that destructive actions, including deleting and updating data, are properly protected by access control identifying sensitive fields such as those that contain passwords or personally identifiable information. Which approach must be used to score the risks proactively?

- A. SAST
- B. CSPM

- C. SBOM Generation
- D. Open API Specification Analysis

Answer: D

Explanation:
Open API Specification Analysis evaluates API definitions before code is written, identifying risky endpoints (such as delete or update functions) and sensitive fields (like PII or passwords). This allows developers to proactively score risks and apply proper access controls early in the design phase.

NEW QUESTION # 72

A construction company recently introduced a BYOD policy, where contractors can bring personal devices and connect to the wireless network. The network engineer configured a Wi-Fi network with a guest splash page to provide internet access only. Although the policy was limited to wireless devices, contractors started bringing devices that needed wired connections without authorization and connecting to the network. The network team suggested shutting down ports where unauthorized devices are connected. Which technology must be implemented to ensure that wired and wireless devices are granted network access only after successful authentication?

- A. VxLANs
- B. private VLANs
- C. 802.1x
- D. VACLs

Answer: C

Explanation:
802.1X provides port-based network access control, requiring devices (wired or wireless) to authenticate before gaining network access. This ensures that only authorized users and devices can connect, enforcing the BYOD policy and preventing unauthorized wired connections.

NEW QUESTION # 73

Which two controls help detect drift in IaC-managed infrastructure? (Choose two.)

- A. Immutable infrastructure patterns
- B. Manual change log entries
- C. DHCP snooping
- D. Continuous configuration monitoring

Answer: A,D

Which protocol must be used in IPsec Phase 2?

- A. ISAKMP

- C. IKE
- D. SD-WAN

Answer: B

for VPN traffic. ESP ensures the highest encryption and protection for sensitive financial data across remote sites.

NEW QUESTION # 75
A product manager is focused on maintaining the security integrity of a microservice-based application as new features are developed and integrated. To ensure that known software vulnerabilities are not introduced into the product, it is crucial to implement a robust application security technique. The technique must be applied during the build phase of the software development lifecycle, which allows the team to proactively entity and address vulnerability risks before deployment. Which application security technique must be applied to accomplish the goal?

- A. container scanning
- B. secret detection
- C. infrastructure as code scanning
- D. Open API specification analysis

Answer: A

Explanation:
Container scanning during the build phase ensures that no known software vulnerabilities are introduced into the application. It scans container images for outdated libraries, misconfigurations, and security flaws before deployment, allowing proactive remediation. This directly supports maintaining the security integrity of a microservice-based application.
