Relativity RCA Torrent | RCA Valid Test Pdf

Candidates who become Relativity RCA certified demonstrate their worth in the Relativity field. RCA certification is proof of their competence and skills. This is a highly sought after credential and it makes career advancement easier for the candidate. To become Relativity RCA Certified, you must pass the Relativity Certified Administrator (RCA) Exam. For this task, you need actual and updated RCA Questions.

Relativity Certified Administrator Sample Questions (Q37-Q42):

NEW QUESTION # 37

You grant the permissions below so that a reviewer on your team can begin creating and running aiR for Review projects. What problem will this reviewer encounter when attempting to analyze documents using aiR for Review?

Object Security:

* aiR for Review Project: View, Edit, Add

* aiR for Review Prompt Criteria: View, Edit, Add

Tab Visibility:

* aiR for Review Projects

- A. Without individual Object Security permissions granted for each analysis type's object, they will not be able to view any results.
- B. Without the tab visibility permission granted for the aiR for Review dashboard, the reviewer will not be able to start the analysis.
- C. They will only be able to view aiR for Review results highlighted in the Viewer.
- D. They will only be able to view aiR for Review projects at the instance-level instead of the workspace level.

Answer: A

Explanation:

The correct answer is A. Relativity's official aiR for Review permissions documentation states that to create and run an aiR for Review project, a user needs object permissions for aiR for Review Project and aiR for Review Prompt Criteria, tab visibility for aiR for Review Projects, and the Run aiR for Review Job permission under Other Settings. The documentation also explicitly states

that a user can run the job without permissions for the analysis types, but will not be able to see the results . The analysis-type objects listed by Relativity are aiR Relevance Analysis , aiR Issue Analysis , aiR Key Analysis , and aiR Summaries . That is exactly the problem in this scenario: the reviewer has enough permissions to create the project shell and prompt criteria, but no permissions were granted for the analysis result objects themselves. As a result, they can initiate work but will not be able to see the analysis results. Option B is incorrect because Viewer highlighting also depends on having analysis-type view permissions. Option C is incorrect because instance- level jobs visibility is a separate permission model. Option D is also incorrect because the provided permissions already include the aiR for Review Projects tab, and the missing issue is not dashboard tab access but the lack of object security for the individual analysis result types . Therefore, the reviewer's main issue is that they will not be able to view any aiR for Review results without the required analysis- type object permissions .

NEW QUESTION # 38

While reviewing documents, the case team wants the ability to apply their Responsiveness tagging from one document to the next. What setting do you need to enable?

- A. Copy from Previous on the layout.
- B. Mass Copy in mass operations.
- C. Local Access permission for the Document object security.
- D. Propagation on the Responsiveness field.

Answer: A

Explanation:

The correct answer is B. Copy from Previous on the layout. Relativity's Copy from Previous documentation explains that you enable this behavior on specific layout fields by setting Enable Copy from Previous to Yes . During review, after saving one document and moving to the next, users can copy the prior document's coding values into the current document for those enabled fields. That directly matches the scenario of carrying Responsiveness tagging from one document to the next.

The other options do not provide that reviewer-interface behavior. Mass Copy is a separate bulk operation and not the per-document review workflow described here. Propagation is a different concept and is not the setting used to let reviewers carry coding values forward document by document. Document Local Access controls access-related actions, not coding carry-forward. Therefore, to let reviewers apply Responsiveness tagging from one document to the next, you enable Copy from Previous on the layout field.

NEW QUESTION # 39

How can you modify a dtSearch index?

- A. The dtSearch index is automatically built upon import and is not customizable.
- B. Configure the index to translate search terms into multiple languages.
- C. Configure the index to be accent sensitive.
- D. Add a repeated content filter.

Answer: C

Explanation:

The correct answer is A. Configure the index to be accent sensitive. Relativity's official dtSearch index documentation lists Create accent sensitive as a configurable Yes/No setting on a dtSearch index. When enabled, the index becomes sensitive to accents and other language-specific characters. This is an example of a valid dtSearch index modification that an administrator can configure.

The other options are incorrect. Relativity does not document a dtSearch feature that translates search terms into multiple languages, so option B is not a valid dtSearch index modification. A repeated content filter is associated with Analytics workflows, not dtSearch index configuration, so option C is also wrong. Option D is clearly incorrect because dtSearch indexes are not simply automatic and fixed upon import; Relativity provides a dedicated dtSearch object with editable settings such as searchable set, sub-index sizing behavior, skip malicious files, and accent sensitivity.

From an RCA perspective, this matters because dtSearch is a configurable search technology in Relativity, and administrators are responsible for tuning it for the needs of a workspace. Accent sensitivity can materially affect search precision in multilingual or language-specific datasets. Therefore, the correct answer is A .

NEW QUESTION # 40

What is true when transferring images from one workspace to another using Relativity Integration Points RIP?

- A. The field mapping section is disabled because only the control number is needed.
- B. The RIP application must be installed in the destination workspace.
- C. The native file used to create the images must be included in the transfer.
- D. The metadata fields from your data source will be auto-mapped and migrated.

Answer: A

Explanation:

The correct answer is A. The field mapping section is disabled because only the control number is needed.

Relativity's official Integration Points documentation for promoting data between workspaces states that when you select Copy Images , the field mapping section is disabled because only the control number is required and available in this scenario . It further notes that if you want to transfer other field metadata, you must create a separate integration point without choosing to copy images. That directly rules out the other options. Relativity does not state that the native file must be included to transfer images in this scenario. It also specifically notes that you are not required to have Integration Points installed on the destination workspace , so option C is incorrect. Option D is wrong because metadata is not automatically mapped and migrated in the Copy Images path; in fact, field mapping is disabled in that configuration.

From an RCA and data-movement perspective, this is a common distinction: image promotion through Integration Points is streamlined and relies on control number matching , not standard metadata field mapping. Therefore, the true statement is A .

NEW QUESTION # 41

In the Audit tab, which of these actions can you revert?

- A. Field - Update
- B. Entity - Merge
- C. Redaction - Update
- D. Document - Update

Answer: D

Explanation:

The correct answer is A. Document - Update . Relativity's official Audit documentation states that system admins can revert coding decisions from the Audit list, and that this action applies to the latest Document Update , Mass Update , or Propagate action on the Document object. That makes Document - Update the correct revertable action among the choices provided.

The other options are not listed by Relativity as revertable audit actions in this context. A Field - Update concerns the field object itself rather than a document coding decision. Entity - Merge may create audit records, but Relativity does not list it as an action that can be reverted through the Audit revert feature.

Redaction - Update is also not one of the documented revertable audit actions under the Audit tab's revert capability. From an RCA perspective, this distinction matters because Audit revert is narrowly scoped to specific document-level update actions and certain supported field types. Therefore, the correct answer is Document - Update .

NEW QUESTION # 42

.....

You can try the free demo version of any Relativity RCA exam dumps format before buying. For your satisfaction, Prep4sureGuide gives you a free demo download facility. You can test the features and then place an order. So, these real and updated Relativity dumps are essential to pass the RCA Exam on the first try.
