The experts and professors of our company have designed the three different versions of the N10-009 prep guide, including the PDF version, the online version and the software version. Now we are going to introduce the online version for you. There are a lot of advantages about the online version of the N10-009 exam questions from our company. For instance, the online version can support any electronic equipment and it is not limited to all electronic equipment. More importantly, the online version of N10-009 study practice dump from our company can run in an off-line state, it means that if you choose the online version, you can use the N10-009 exam questions when you are in an off-line state. In a word, there are many advantages about the online version of the N10-009 prep guide from our company.

One of the most significant parts of your CompTIA N10-009 certification exam preparation is consistent practice. BraindumpsPass has make sure that you get sufficient N10-009 exam practice by adding CompTIA N10-009 desktop practice exam software to your study course. This CompTIA N10-009 desktop-based practice exam software is compatible with all windows-based devices.

## CompTIA Network+ Certification Exam Sample Questions (Q294-Q299):

### NEW QUESTION # 294

A network engineer is designing a secure communication link between two sites. The entire data stream needs to remain confidential. Which of the following will achieve this goal?

- A. ESP
- B. IKE
- C. AH
- D. GRE

**Answer: A**

Explanation:

\* Definition of ESP (Encapsulating Security Payload):

\* ESP is a part of the IPsec protocol suite designed to provide confidentiality, integrity, and authenticity of data by encrypting the payload and optional ESP trailer.

\* Ensuring Confidentiality:

\* Encryption: ESP encrypts the payload, ensuring that the data remains confidential during transmission. Only authorized parties with the correct decryption keys can access the data.

\* Modes of Operation: ESP can operate in transport mode (encrypts only the payload) or tunnel mode (encrypts the entire IP packet), both providing strong encryption to secure data between sites.

\* Comparison with Other Protocols:

\* GRE (Generic Routing Encapsulation): A tunneling protocol that does not provide encryption or security features.

\* IKE (Internet Key Exchange): A protocol used to set up a secure, authenticated communications channel, but it does not encrypt the data itself.

\* AH (Authentication Header): Provides integrity and authentication for IP packets but does not encrypt the payload.

\* Implementation:

\* Use ESP as part of an IPsec VPN configuration to encrypt and secure communication between two sites. This involves setting up IPsec policies and ensuring both endpoints are configured to use ESP for data encryption.

### NEW QUESTION # 295

A company is hosting a secure web server that requires all connections to the server to be encrypted. A junior administrator needs to harden the web server. The following ports are open on the web server. Which of the following ports should be disabled?

Which of the following ports should be disabled?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: B**

Explanation:

For a web server that requires all connections to be encrypted, port 80 (HTTP) should be disabled. Port 80 is used for unencrypted web traffic, whereas port 443 is used for HTTPS, which provides encrypted communication.

Port 80 (HTTP): This port is used for unsecured web traffic. Disabling this port ensures that all web traffic must use HTTPS, which encrypts the data in transit.

Port 443 (HTTPS): This port is used for secure web traffic via SSL/TLS encryption. Keeping this port open ensures that secure connections can be made to the web server.

Other Ports:

Port 22: Used for SSH, providing secure remote access and file transfers.

Port 587: Used for secure email submission (SMTP) with encryption.

### NEW QUESTION # 296

Which of the following allows a remote user to connect to the network?

- **A. Client-to-site VPN**
- B. Command-line interface
- C. API gateway
- D. Jump box

**Answer: A**

### NEW QUESTION # 297

Users are unable to access files on their department share located on file\_server 2. The network administrator has been tasked with validating routing between networks hosting workstation A and file server 2.

### NEW QUESTION # 298

Due to concerns around single points of failure, a company decided to add an additional WAN to the network. The company added a second MPLS vendor to the current MPLS WAN and deployed an additional WAN router at each site. Both MPLS providers use OSPF on the WAN network, and EIGRP is run internally. The first site to go live with the new WAN is successful, but when the second site is activated, significant network issues occur. Which of the following is the most likely cause for the WAN instability?

- **A. Asymmetrical routing**
- B. A switching loop
- C. An incorrect IP address
- D. A changed CDP neighbor

**Answer: A**

Explanation:

Asymmetrical routing occurs when packets take different paths to and from the destination, leading to instability in network communication. The use of two different MPLS providers with OSPF can lead to this type of routing issue, especially if the paths aren't carefully configured and managed. This can cause unexpected routing behaviors and instability in a dual-WAN setup.
