질문 # 72

Refer to the exhibit:

Refer to the exhibit. Which configuration change command must be run on the Cisco NX-OS device to make this command work?

- A. enable bash-shell
- B. feature bash-shell
- C. bash-shell enable
- D. service bash-shell

정답: D

질문 # 73

While reviewing Ansible task output, an engineer notices that a task using the `cisco.nxos.nxos\_config` module with `lines: ["interface Ethernet1/1", "description LINK-A"]` reports `changed: true` on every single playbook run, even though the configuration is already present on the device. What is the most likely cause?

- A. The task lacks a `parents` or matching context, or the `match` parameter is set in a way that fails to correctly detect the existing configuration line as already present, causing the module to always attempt to push it
- B. The device does not support idempotent operations at all
- C. `nxos\_config` never supports idempotency by design
- D. The `lines` list must be alphabetically sorted for idempotency to work

정답: A

설명:

`nxos\_config` (and similar `\*\_config` resource modules) achieves idempotency by comparing the intended `lines` (often under a given `parents` context, e.g., inside the correct interface stanza) against the current running configuration, using a `match` strategy (`line`, `strict`, `exact`, or `none`). If `parents` is missing or `match` is misconfigured (e.g., `match: none`, which always pushes), or the line format doesn't textually match existing config exactly, the module cannot detect "already present" and will report changed every time. NX-OS/Ansible modules do generally support idempotency when configured correctly, so A and C are false; there is no alphabetical sorting requirement (D is a nonsense distractor).
