AWS-Solutions-Architect-Professional Original Questions, AWS-Solutions-Architect-Professional Latest Practice Questions

Rather than pretentious help for customers, our after-seals services are authentic and faithful. Many clients cannot stop praising us in this aspect and become regular customer for good. We have strict criterion to help you with the standard of our AWS-Solutions-Architect-Professional training materials. Our company has also being Customer First. So we consider the facts of your interest firstly. All the preoccupation based on your needs and all these explain our belief to help you have satisfactory and comfortable purchasing services. We assume all the responsibilities our AWS-Solutions-Architect-Professional simulating practice may bring you foreseeable outcomes and you will not regret for believing in us assuredly.

The AWS Certified Solutions Architect - Professional certification exam is a highly regarded credential for IT professionals looking to validate their expertise in designing and deploying scalable, fault-tolerant, and highly available systems on the Amazon Web Services (AWS) platform. AWS-Solutions-Architect-Professional Exam Tests the knowledge and skills required to design and deploy dynamically scalable, highly available, fault-tolerant, and reliable applications on AWS.

Amazon AWS Certified Solutions Architect - Professional Sample Questions (Q288-Q293):

NEW QUESTION # 288

You are the new IT architect in a company that operates a mobile sleep tracking application.

When activated at night, the mobile app is sending collected data points of 1 kilobyte every 5 minutes to your backend.

The backend takes care of authenticating the user and writing the data points into an Amazon DynamoDB table.

Every morning, you scan the table to extract and aggregate last night's data on a per user basis, and store the results in Amazon S3.

Users are notified via Amazon SNS mobile push notifications that new data is available, which is parsed and visualized by the mobile app. Currently you have around 100k users who are mostly based out of North America.

You have been tasked to optimize the architecture of the backend system to lower cost.

What would you recommend? Choose 2 answers

- A. Create a new Amazon DynamoDB table each day and drop the one for the previous day after its data is on Amazon S3.
- B. Write data directly into an Amazon Redshift cluster replacing both Amazon DynamoDB and Amazon S3.
- C. Introduce Amazon ElastiCache to cache reads from the Amazon DynamoDB table and reduce provisioned read throughput.
- D. Introduce an Amazon SQS queue to buffer writes to the Amazon DynamoDB table and reduce provisioned write throughput.
- E. Have the mobile app access Amazon DynamoDB directly instead of JSON files stored on Amazon S3.

Answer: A,D

Explanation:

C - reduced provisioned write capacity to the table, SQS will send regular inputs and absorb sudden higher load E - dropping old no longer needed data will save cost.

D is wrong because read is only performed when exporting data to S3, then the backend reads all from S3 so reducing provisioned read throughput on the DynamoDB table is useless.

NEW QUESTION # 289

A company runs an IoT platform on AWS. IoT sensors in various locations send data to the company's Node.js API servers on Amazon EC2 instances running behind an Application Load Balancer. The data is stored in an Amazon RDS MySQL DB instance that uses a 4 TB General Purpose SSD volume.

The number of sensors the company has deployed in the field has increased over time, and is expected to grow significantly. The API servers are consistently overloaded and RDS metrics show high write latency.

Which of the following steps together will resolve the issues permanently and enable growth as new sensors are provisioned, while keeping this platform cost-efficient? (Choose two.)

- A. Use AWS-X-Ray to analyze and debug application issues and add more API servers to match the load
- B. Resize the MySQL General Purpose SSD storage to 6 TB to improve the volume's IOPS
- C. Leverage Amazon Kinesis Data Streams and AWS Lambda to ingest and process the raw data
- D. Re-architect the database tier to use Amazon Aurora instead of an RDS MySQL DB instance and add read replicas
- E. Re-architect the database tier to use Amazon DynamoDB instead of an RDS MySQL DB instance

Answer: B

NEW QUESTION # 290

In Amazon Redshift, how many slices does a dw2.8xlarge node have?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: D

Explanation:

The disk storage for a compute node in Amazon Redshift is divided into a number of slices, equal to the number of processor cores on the node. For example, each DW1.XL compute node has two slices, and each DW2.8XL compute node has 32 slices.

http://docs.aws.amazon.com/redshift/latest/dg/t_Distributing_data.html

NEW QUESTION # 291

You're trying to delete an SSL certificate from the IAM certificate store, and you're getting the message "Certificate: <certificate-id> is being used by CloudFront." Which of the following statements is probably the reason why you are getting this error?

- A. Before you can delete an SSL certificate you need to set up https on your server.
- **B. Before you can delete an SSL certificate, you need to either rotate SSL certificates or revert from using a custom SSL certificate to using the default CloudFront certificate.**
- C. Before you can delete an SSL certificate, you need to set up the appropriate access level in IAM
- D. You can't delete SSL certificates . You need to request it from AWS.

Answer: B

Explanation:

CloudFront is a web service that speeds up distribution of your static and dynamic web content, for example, .html, .css, .php, and image files, to end users. Every CloudFront web distribution must be associated either with the default CloudFront certificate or with a custom SSL certificate.

Before you can delete an SSL certificate, you need to either rotate SSL certificates (replace the current custom SSL certificate with another custom SSL certificate) or revert from using a custom SSL certificate to using the default CloudFront certificate.

NEW QUESTION # 292

A Solutions Architect is asked to improve the fault tolerance of an existing Python application. The web application places 1-MB images in an S3 bucket. The application then uses a single t2.large instance to transform the image to include a watermark with the company's brand before writing the image back to the S3 bucket.

What should the Solutions Architect recommend to increase the fault tolerance of the solution?

- **A. Convert the code to a Lambda function triggered by scheduled Amazon CloudWatch Events.**
- B. Increase the instance size to m4.xlarge and configure Enhanced Networking.
- C. Convert the code to a Lambda function triggered by Amazon S3 events.
- D. Create an Amazon SQS queue to send the images to the t2.large instance.

Answer: A

NEW QUESTION # 293

.....

The Amazon AWS-Solutions-Architect-Professional web-based practice test software is very user-friendly and simple to use. It is accessible on all browsers (Chrome, Firefox, MS Edge, Safari, Opera, etc). It will save your progress and give a report of your mistakes which will surely be beneficial for your overall AWS-Solutions-Architect-Professional Exam Preparation.
