## ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q254-Q259):

### NEW QUESTION # 254

What does configuration management enable for testing?

- A. It enables the scheduling of test resources.
- B. It enables the creation of test progress reports.
- C. It enables the derivation of test cases and test data.
- D. It enables the versioning of the test elements.

**Answer: D**

#### NEW QUESTION # 255

Which of the following is NOT an objective of testing?

- A. Finding defects
- B. Gaining confidence about the level of quality of the software
- C. Providing information for decision-making
- **D. Analyzing and removing the cause of failures**

**Answer: D**

Explanation:

Analyzing and removing the cause of failures is not an objective of testing, but rather a task of development or maintenance. A failure is an event or behavior that deviates from the expected or specified result of a system under test. A failure is caused by an error (also known as a mistake or a fault) in the software code, design, or specification. Analyzing and removing the cause of failures is a process of locating and fixing errors in the software code, design, or specification, which is also known as debugging or defect resolution. Analyzing and removing the cause of failures does not aim to find or report defects, but rather to correct or prevent them. The other options are objectives of testing. Finding defects is one of the main objectives of testing, as it helps to improve the quality and reliability of the software product. Providing information for decision-making is another objective of testing, as it helps to support decision making and risk management. Gaining confidence about the level of quality of the software is another objective of testing, as it helps to assure that the software product meets its requirements and customer or user needs and expectations. #### NEW QUESTION # 256

Scenario 1 "Happy Tomatoes" (used for questions 20-22):

An intelligent application for agricultural use incorporates temperature sensors located at different points of an enclosure. The sensors measure and record the temperature at regular intervals and extract the statistical values for these measurements. These values include the average daily temperature.

A new variety of tomatoes is currently being grown and the "World Organization for Happy Tomatoes" has established temperature ranges related to vegetative development.

When the system establishes that the average temperature is within a specific range, it emits a value that will be used to monitor and control the crop.

Using the equivalence partitioning technique, identify the set of input values that provides the HIGHEST coverage.

- A. {7,10,21,40}
- B. {8,10,25,40}
- C. {7,10,25,40}
- **D. {7,10,25,29}**

**Answer: D**

Explanation:

Comprehensive and Detailed In-Depth Explanation: Equivalence partitioning (EP) divides input values into classes where test cases represent all possible values of each partition. The partitions in this scenario are:

\* #7 (too cold # W)

\* 8-21 (standstill # X)

\* 22-29 (ideal # Y)

\* #30 (too hot # Z)

Option C ({7,10,25,29}) covers all partitions by selecting representative values:

\* 7 # Too cold (W)

\* 10 # Standstill (X)

\* 25 # Ideal (Y)

\* 29 # Upper boundary of ideal (Y)

Other options do not cover all partitions adequately.

#### NEW QUESTION # 257

The following requirement is given "Set X to be the sum of Y and Z".  
All the following four implementations have bugs.  
Which one of the following bugs can be caught by Static Analysis?

- A. `int y = 2`  
`Int z = 3.`  
`Y = z+y`
- B. `int x = 1.`  
`int y = 2.`  
`int y = 3.`  
`X = y=z;`
- C. `int x = 1.`  
`Int y = 2.`  
`Int z = 3.`  
`Z = x +y`
- D. `int x = 1.`  
`int y = 2.`  
`int z = 3.`  
`X = z-y`

**Answer: B**

Explanation:

Static analysis is a technique that analyzes the source code or other software artifacts without executing them.

Static analysis can detect defects such as syntax errors, coding standards violations, potential security vulnerabilities, or logical flaws.

Static analysis can catch the bug in the first implementation, as it contains two syntax errors: the variable y is declared twice, and the assignment statement `X = y=z` is invalid. Static analysis cannot catch the bugs in the other three implementations, as they are logical errors that do not violate any syntax rules, but produce incorrect results. #### NEW QUESTION # 258

4 equivalence classes are given for integer values:

$0 < x < 100$

$100 \leq x \leq 200$

$200 < x < 500$

$x \geq 500$

Which of the following options represent correct set of data for valid equivalence class partitions?

- A. 0.50; 100; 150.200.350.500;
- B. 50; 100; 250; 1000
- C. 0. 1.99, 100.200,201.499, 500;
- D. 50; 100; 200. 1000

**Answer: A**

Explanation:

The correct set of data for valid equivalence class partitions should include one value from each equivalence class, and no value from outside the range. Option C satisfies this condition, as it has one value from each of the four equivalence classes (50, 100, 250, 500). Option A has two values from the same equivalence class (100 and 200), option B has values outside the range (0 and 0.99), and option D has two values from the same equivalence class (1000 and 500).
