AAISM최신 기출문제 시험 기출자료

ExamPassdump연구한 전문ISACA AAISM인증시험을 겨냥한 덤프가 아주 많은 인기를 누리고 있습니다. ExamPassdump제공되는 자료는 지식을 장악할 수 있는 반면 많은 경험도 쌓을 수 있습니다. ExamPassdump는 많은 IT 인사들의 요구를 만족시켜드릴 수 있는 사이트입니다. 비록ISACA AAISM인증시험은 어렵지만 우리ExamPassdump의 문제집으로 가이드 하면 여러분은 아주 자신만만하게 응시하실 수 있습니다. 안심하시고 우리 ExamPassdump가 제공하는 알맞춤 문제집을 사용하시고 완벽한ISACA AAISM인증시험 준비를 하세요.

최신 Isaca Certification AAISM 무료샘플문제 (Q144-Q149):

질문 # 144

An organization is implementing AI agent development across multiple engineering teams. Which of the following is the MOST important focus of AI-specific security training for developers?

- A. Dataset bias, explainability, and fairness in model decisions
- B. API abuse, data leakage, and third-party plug-in risk
- C. Prompt injection, agent memory control, and insecure tool execution
- D. Output moderation, hallucination handling, and policy alignment

정답: C

설명:

For developer-facing, near-term hardening of AI agents, AAISM prioritizes secure agent design and runtime controls against prompt injection, unsafe memory/tool use, and tool-execution compromise. These are primary exploitation paths for agents that read external content, persist memory, and call tools with elevated privileges. Training must center on: guarding tool invocation, constraining memory scope, sanitizing

/validating inputs, and isolating high-risk actions. Topics like bias/fairness (B) and policy/hallucinations (C) are important but are governance/assurance concerns; API abuse and plug-in risk (D) matter, yet the core, developer-controlled attack surface for agents is injection and unsafe tool/memory design.

질문 # 145

An organization is deploying a large language model (LLM) and is concerned that input manipulations may compromise its integrity. Which of the following is the MOST effective way to determine an acceptable risk threshold?

- A. Deploy a real-time logging and monitoring system
- B. Restrict all user inputs containing special characters
- C. Assess the business impact of known threats
- D. Implement a static risk threshold by limiting LLM outputs

정답: C

설명:

AAISM requires that risk thresholds/tolerances be set by aligning threat likelihood and impact with the organization's business

context and risk appetite. Determining "acceptable" risk starts with assessing business impact of credible threats (e.g., prompt injection leading to data exfiltration, policy evasion, or harmful actions), then translating this into control intensity and thresholds. Hard input restrictions (A) and static output caps (C) are blunt measures that may degrade utility without ensuring alignment to risk appetite. Monitoring (B) is essential for detection, but it does not, by itself, define what level of risk is acceptable. References: AI Security Management™ (AAISM) Body of Knowledge - Risk Appetite and Tolerance for AI; Threat Modeling for LLMs; Business Impact Analysis and Risk Acceptance Criteria.

질문 # 146

An organization is facing a deepfake attack intended to manipulate stock prices. The organization's crisis communication plan has been activated. Which of the following is MOST important to include in the initial response?

- A. Provide clarifying information in a pre-approved public statement
- B. Conduct employee awareness training on recognizing deepfake videos and audio
- C. Engage with brand monitoring services to track social media activity
- D. Conduct a detailed forensic analysis to identify the source of the deepfake

정답: A

설명:

AAISM guidance on crisis management and communication emphasizes that the initial priority in responding to a reputational or market manipulation attack is to provide accurate clarifying information to the public through a pre-approved statement. This ensures stakeholders and markets are given verified facts immediately, limiting the spread of misinformation. While forensic analysis, employee training, and monitoring activities are important, they occur after the immediate need for public trust and damage control is addressed. Pre-approved statements are a central control in AI-related incident response to ensure consistency, timeliness, and credibility in communications.

질문 # 147

Within an incident handling process, which of the following would BEST help restore end-user trust in an AI system?

- A. The AI model prioritizes incidents based on business impact
- B. AI is used to monitor incident detection and alerts
- C. Remediation of the AI system based on lessons learned
- D. The AI model's outputs are validated by team members

정답: C

설명:

AAISM highlights that post-incident remediation and demonstrating lessons learned is essential to restoring trust. Governance guidance specifies that stakeholders regain confidence only when organizations show clear corrective actions, transparency, and improvements to prevent recurrence.

Validating outputs (B) supports accuracy but is not trust-restoring. Monitoring (C) and prioritization (D) relate to operations, not trust rebuilding.

References: AAISM Study Guide - AI Governance; Incident Response and Trust Restoration.

질문 # 148

A viral video shows a blurry person making claims about a product safety issue. The video has random low-quality sections. This MOST likely represents what threat?

- A. Data poisoning
- B. Hallucinations
- C. Deepfake
- D. Model drift

정답: C

설명:

AAISM defines deepfakes as manipulated media where individuals appear in synthetic or altered video/audio.

Indicators include:

- * blurred or inconsistent facial rendering
- * mismatched frames
- * low-quality or distorted transitions

These characteristics match the scenario provided.

Hallucinations (A) relate to model outputs, not video manipulation. Drift (B) affects model performance.

Poisoning (C) affects training data, not video content.
