You may urgently need to attend CCDAK certificate exam and get the certificate to prove you are qualified for the job in some area. But what certificate is valuable and useful and can help you a lot? Passing the CCDAK test certification can help you prove that you are competent in some area and if you buy our CCDAK Study Materials you will pass the test almost without any problems for we are the trustful vendor of the CCDAK practice guide for years.

The CCDAK exam is a comprehensive assessment of a developer's knowledge of the Kafka ecosystem and its various components, such as Kafka Connect, Kafka Streams, and Schema Registry. CCDAK exam covers a broad range of topics, including Kafka architecture, data modeling, event-driven design, and security. Developers who pass the CCDAK exam will have demonstrated their ability to develop Kafka-based applications that are scalable, reliable, and secure, and they will be recognized as experts in the Kafka ecosystem. The CCDAK Certification is an essential credential for developers who wish to work with Kafka and Confluent's platform and is highly valued by organizations that use Kafka as their messaging and streaming platform.

CCDAK Exam Sample Questions | CCDAK New Dumps Sheet

After you used TestValid Confluent CCDAK Dumps, you still fail in CCDAK test and then you will get FULL REFUND. This is TestValid's commitment to all candidates. What's more, the excellent dumps can stand the test rather than just talk about it.

TestValid test dumps can completely stand the test of time. TestValid present accomplishment results from practice of all candidates. Because it is right and reliable, after a long time, TestValid exam dumps are becoming increasingly popular.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q28-Q33):

NEW QUESTION # 28

What is a generic unique id that I can use for messages I receive from a consumer?

- A. topic + partition + timestamp
- B. topic + timestamp
- C. topic + partition + offset

Answer: C

Explanation:

(Topic,Partition,Offset) uniquely identifies a message in Kafka

NEW QUESTION # 29

(Your application consumes from a topic configured with a deserializer.

You want the application to be resilient to badly formatted records (poison pills).

You surround the poll() call with a try/catch block for RecordDeserializationException.

You need to log the bad record, skip it, and continue processing other records.

Which action should you take in the catch block?)

- A. Throw a runtime exception to trigger a restart of the application.
- B. Log the bad record; no other action is needed.
- C. Log the bad record and call consumer.skip() method.
- D. Log the bad record and seek the consumer to the offset of the next record.

Answer: D

Explanation:

The Apache Kafka consumer documentation explains that when a RecordDeserializationException occurs, the consumer cannot continue polling until the problematic offset is skipped. Simply logging the error is insufficient, because the consumer will repeatedly fail on the same record.

The recommended pattern is to log the malformed record, extract its topic, partition, and offset from the exception, and then call consumer.seek() to move the consumer position to the next offset (offset + 1). This allows the application to skip the poison pill and resume processing subsequent records.

Option B is invalid because Kafka does not provide a consumer.skip() API. Option C is unnecessary if the application is designed to tolerate malformed records. Option D results in an infinite failure loop.

Therefore, seeking past the bad record after logging it is the correct and officially documented way to handle poison pill records while maintaining consumer liveness and resilience.

NEW QUESTION # 30

You want to perform table lookups against a KTable everytime a new record is received from the KStream.

What is the output of KStream-KTable join?

- A. You choose between KStream or KTable
- B. Kstream
- C. GlobalKTable
- D. KTable

Answer: B

Explanation:

Here KStream is being processed to create another KStream.

NEW QUESTION # 31

There are 3 brokers in the cluster. You want to create a topic with a single partition that is resilient to one broker failure and one broker maintenance. What is the replication factor will you specify while creating the topic?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

1 is not possible as it doesn't provide resilience to failure, 2 is not enough as if we take a broker down for maintenance, we cannot tolerate a broker failure, and 6 is impossible as we only have 3 brokers (RF cannot be greater than the number of brokers). Here the correct answer is 3

NEW QUESTION # 32

What happens when broker.rack configuration is provided in broker configuration in Kafka cluster?

- A. Each rack contains all the topics and partitions, effectively making Kafka highly available
- **B. Replicas for a partition are spread across different racks**
- C. You can use the same broker.id as long as they have different broker.rack configuration
- D. Replicas for a partition are placed in the same rack

Answer: B

Explanation:

Partitions for newly created topics are assigned in a rack alternating manner, this is the only change broker.rack does

NEW QUESTION # 33

.....

Everyone wishes to spend their career at one level. Obtaining a Confluent Certified Developer for Apache Kafka Certification Examination CCDAK certificate is the reason that many people join the Confluent CCDAK exam. They can be sure of earning promotions and higher pay at their current job with this credential. While attempting career growth is crucial, you can only do so after clearing the Confluent Certified Developer for Apache Kafka Certification Examination CCDAK Exam.
