

# Free PDF Quiz High Pass-Rate AACN - CCRN-Pediatric - Reliable Critical Care Nursing Exam Mock Test

## CCRN Pediatric Practice Exam Questions from AACN 150 Questions, Answers, and Rationale from AACN Practice Book

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
  - B) Encourage the parents to minimize their expression of grief with the sibling
  - C) Explain to the sibling that the infant went to heaven
  - D) Explain to the sibling that thoughts and wishes did not cause the infant's death
- Correct Answer: Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes.
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem.

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
  - B) the patient having a CT scan followed by possible shunt revision
  - C) Administering mannitol or hypertonic saline
  - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx)
- Correct Answer: Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.
- C) Administering mannitol or hypertonic saline: These medication are indicated for the medical management of increased intracranial pressure, of which this patient has symptoms. However, they will not address the most likely primary problem, which is suspected VP shunt malfunction.
- D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx): These medications are indicated for seizure management and would not address the patient's most likely primary problem, which is suspected increased intracranial pressure as a result of VP shunt malfunction.

An adolescent trauma patient is complaining of left upper quadrant abdominal pain radiating to the left shoulder. Blood pressure has dropped to 80/50. Which condition is most likely?

- A) Small Bowel Injury
- B) Cardiac Contusion

## Simplified Document Sharing and Accessibility With AACN CCRN-Pediatric PDF Questions

You will find the same ambiance and atmosphere when you attempt the real AACN CCRN-Pediatric exam. It will make you

practice nicely and productively as you will experience better handling of the Critical Care Nursing Exam questions when you take the actual AACN CCRN-Pediatric Exam to grab the AACN CCRN-Pediatric certification.

AACN CCRN-Pediatric (Critical Care Nursing) Certification Exam is designed for nurses who work in pediatric intensive care units (PICUs) and pediatric cardiac care units (PCCUs). Critical Care Nursing Exam certification exam is administered by the American Association of Critical-Care Nurses (AACN) and is one of the most respected and recognized credentials in the field of pediatric critical care nursing.

## AACN Critical Care Nursing Exam Sample Questions (Q149-Q154):

### NEW QUESTION # 149

A 3-month-old infant was brought back to the unit after a surgery for hypertrophic pyloric stenosis. The mother was very good in caring for the client but is reluctant with regard to feeding. Probably the mother is:

- A. not aware that her baby is allowed to resume feedings.
- B. in doubt about the safety of the special nipple.
- C. afraid that her baby will vomit again.
- D. uncertain if her baby can tolerate the thickened formula.

**Answer: C**

Explanation:

Explanation: Past experiences with projectile vomiting are frightening. It is the responsibility of the nurse to explain that it will not happen again. No special nipple is needed in this situation.

### NEW QUESTION # 150

An infant has hypovolemic shock from severe diarrhea. Which of the following assessments demonstrates adequate tissue perfusion following fluid resuscitation?

Capillary Refill

Urine Output

CVP

BP

a. 2 sec

0.5 ml/kg/hr

2 mm Hg

84/50

b. 3 sec

0.5 ml/kg/hr

6 mm Hg

72/44

c. 3 sec

1.2 ml/kg/hr

4 mm Hg

72/48

d. 2 sec

1.2 ml/kg/hr

8 mm Hg

80/54

- A. Option A
- B. Option C
- C. Option B
- D. Option D

**Answer: D**

Explanation:

Indicators of adequate tissue perfusion following fluid resuscitation include:

\* Capillary refill #2 seconds

\* Urine output #1 mL/kg/hr

\* Normal CVP(4-10 mm Hg in infants)

\* Age-appropriate blood pressure

Option D is the only one where all parameters are within normal ranges, reflecting effective volume resuscitation and adequate perfusion.

"Capillary refill <2 sec, urine output >1 mL/kg/hr, and CVP in the normal range indicate improved perfusion in shock management." (Referenced from CCRN Pediatric - Direct Care: Multisystem, Shock States and Resuscitation Targets)

#### NEW QUESTION # 151

An 8-year-old patient who sustained intracerebral hemorrhage after a traumatic incident was intubated in the field. Head CT scan showed a 5 mm midline shift. The patient is difficult to arouse but pulls away from noxious stimuli. The most concerning sign of clinical deterioration is:

- A. BP 138/98 with HR of 50
- B. Cerebral perfusion pressure (CPP) of 55 mm Hg
- C. Ecchymosis over the mastoid processes
- D. Pupils are 5 mm and reactive bilaterally

**Answer: A**

Explanation:

Arising blood pressure with bradycardia (Cushing's triad) suggests increased intracranial pressure and impending herniation. This is the most critical and time-sensitive sign of neurologic deterioration.

"Signs of increased ICP and impending herniation include bradycardia, hypertension, and irregular respiration. These warrant immediate intervention to prevent irreversible brain injury." (Referenced from CCRN Pediatric - Direct Care: Neurological Trauma and Intracranial Hypertension)

#### NEW QUESTION # 152

Which of the following immunizations would the nurse expect to administer to a child who is HIV (+) and severely immunocompromised:

- A. Rotavirus
- B. DTaP
- C. IPV
- D. MMR

**Answer: C**

Explanation:

Explanation: IPV or Inactivated polio vaccine does not contain live micro organisms which can be harmful to an immunocompromised child. Unlike OPV, IPV is administered via IM route.

#### NEW QUESTION # 153

What nursing action should be done in an infant who receives IVF via a scalp vein:

- A. restrain the extremities when there's no one to see the child.
- B. assess the pupils every 1 hour for any untoward reaction.
- C. assess for signs of infiltration behind the occiput
- D. explain to the parents that they can't hold the client while the IV therapy is ongoing.

**Answer: A**

Explanation:

Explanation: Extremities need to be restrained as infants use them to dislodge the needle. Pupillary reaction and assessing at the occiput do not relate to scalp vein and IV therapy.

#### NEW QUESTION # 154

.....

The AACN CCRN-Pediatric certification exam is one of the hottest and career-oriented Critical Care Nursing Exam (CCRN-Pediatric) exams. With the Critical Care Nursing Exam (CCRN-Pediatric) exam you can validate your skills and upgrade your knowledge level. By doing this you can learn new in-demand skills and gain multiple career opportunities. To do this you just need to enroll in the AACN CCRN-Pediatric Certification Exam and put all your efforts to pass this important AACN CCRN-Pediatric Exam Questions. However, you should keep in mind that to get success in the Critical Care Nursing Exam (CCRN-Pediatric) exam is not an easy task.
