Quiz 2026 ECCouncil 312-50v13–High Pass-Rate Exam Simulator

What's more, part of that Real4test 312-50v13 dumps now are free: https://drive.google.com/open?id=12P_Yi8nSxJ_V1Q-YXqk3Oo_VR6BPbx36

For the challenging ECCouncil 312-50v13 exam, they make an effort to locate reputable and recent ECCouncil 312-50v13 practice questions. The high anxiety and demanding workload the candidate must face being qualified for the ECCouncil 312-50v13 Certification are more difficult than only passing the ECCouncil 312-50v13 exam.

ECCouncil 312-50v13 Exam Syllabus Topics:

Section	Objectives
Topic 1: Network Attacks	- Denial of Service (DoS/DDoS) - Sniffing and session hijacking
Topic 2: Cryptography	- Encryption, hashing, and cryptanalysis
Topic 3: Cloud and IoT Security	- IoT security fundamentals - Cloud computing security concepts
Topic 4: Web and Application Security	- Web application hacking techniques
Topic 5: Introduction to Ethical Hacking	- Ethical hacking concepts and methodology
Topic 6: System Hacking	- Malware threats and system exploitation - Gaining access and privilege escalation
Topic 7: Reconnaissance Techniques	- Scanning networks and enumeration - Footprinting and information gathering
Topic 8: Wireless and Mobile Security	- Mobile platform vulnerabilities - Wireless network attacks

First-grade 312-50v13 Learning Engine: Certified Ethical Hacker Exam (CEHv13) Offer You Amazing Exam Questions - Real4test

Considering your practical constraint and academic requirements of the 312-50v13 exam preparation, you may choose the 312-50v13 practice materials with following traits. High quality and accuracy with trustworthy reputation; processional experts group specific in this line; considerate after-sales services are having been tested and verified all these years, 312-50v13 training guide is fully applicable to your needs.

ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions

(Q258-Q263):

NEW QUESTION # 258
After an audit, the auditors Inform you that there is a critical finding that you must tackle Immediately. You read the audit report, and the problem is the service running on port 389. Which service Is this and how can you tackle the problem?

- A. The service is LDAP. and you must change it to 636. which is LDPAPS.
- B. The findings do not require immediate actions and are only suggestions.
- C. The service is SMTP, and you must change it to SMIME. which is an encrypted way to send emails.
- D. The service is NTP. and you have to change It from UDP to TCP in order to encrypt it

Answer: A

Explanation:
https://en.wikipedia.org/wiki/Lightweight_Directory_Access_Protocol
LDAP, the Lightweight Directory Access Protocol, is a mature, flexible, and well supported standards-based mechanism for interacting with directory servers. It's often used for authentication and storing information about users, groups, and applications, but an LDAP directory server is a fairly general-purpose data store and can be used in a wide variety of applications.
The LDAP protocol can deal in quite a bit of sensitive data: Active Directory usernames, login attempts, failed-login notifications, and more. If attackers get ahold of that data in flight, they might be able to compromise data like legitimate AD credentials and use it to poke around your network in search of valuable assets.
Encrypting LDAP traffic in flight across the network can help prevent credential theft and other malicious activity, but it's not a failsafe-and if traffic is encrypted, your own team might miss the signs of an attempted attack in progress.
While LDAP encryption isn't standard, there is a nonstandard version of LDAP called Secure LDAP, also known as "LDAPS" or "LDAP over SSL" (SSL, or Secure Socket Layer, being the now-deprecated ancestor of Transport Layer Security).
LDAPS uses its own distinct network port to connect clients and servers. The default port for LDAP is port
389, but LDAPS uses port 636 and establishes TLS/SSL upon connecting with a client.

NEW QUESTION # 259
To hide the file on a Linux system, you have to start the filename with a specific character. What is the character?

- A. Tilde (~)
- B. Period (.)
- C. Exclamation mark (!)
- D. Underscore (_)

Answer: B

NEW QUESTION # 260
An IDS generates alerts during normal user activity. What is the most likely cause?

- A. Firewall failure
- B. IDS outdated
- C. Excessive IDS sensitivity causing false positives
- D. Users triggering protocols

Answer: C

Explanation:
In CEH v13, IDS effectiveness is closely tied to proper signature tuning and sensitivity thresholds. When IDS alerts are triggered by legitimate user behavior, the most common cause is overly sensitive configuration, resulting in false positives.
False positives occur when normal traffic patterns match intrusion signatures. CEH v13 emphasizes that IDS systems must be calibrated to the organization's baseline traffic profile. Without tuning, IDS logs become noisy and reduce analyst effectiveness.
Firewall issues (Option A) and outdated IDS signatures (Option B) can cause missed detections, not excessive alerts. Users unintentionally triggering protocols (Option D) is not a root cause but a symptom of misconfiguration.
Thus, excessive IDS sensitivity is the correct explanation.

NEW QUESTION # 261
Susan, a software developer, wants her web API to update other applications with the latest information. For this purpose, she uses a user-defined HTTP tailback or push APIs that are raised based on trigger events:
when invoked, this feature supplies data to other applications so that users can instantly receive real-time Information.
Which of the following techniques is employed by Susan?

- A. Webhooks
- B. REST API
- C. SOAP API
- D. web shells

Answer: A

Explanation:
Webhooks are one of a few ways internet applications will communicate with one another.
It allows you to send real-time data from one application to another whenever a given event happens.
For example, let's say you've created an application using the Foursquare API that tracks when people check into your restaurant.
You ideally wish to be able to greet customers by name and provide a complimentary drink when they check in.
What a webhook will is notify you any time someone checks in, therefore you'd be able to run any processes that you simply had in your application once this event is triggered.
The data is then sent over the web from the application wherever the event originally occurred, to the receiving application that handles the data.
Here's a visual representation of what that looks like:

real4test.com
EC-Council

A webhook url is provided by the receiving application, and acts as a phone number that the other application will call once an event happens.
Only it's more complicated than a phone number, because data about the event is shipped to the webhook url in either JSON or XML format. this is known as the "payload." Here's an example of what a webhook url looks like with the payload it's carrying:

EC-Council
real4test.com

What are Webhooks? Webhooks are user-defined HTTP callback or push APIs that are raised based on events triggered, such as comment received on a post and pushing code to the registry. A webhook allows an application to update other applications with the latest information. Once invoked, it supplies data to the other applications, which means that users instantly receive real-time information. Webhooks are sometimes called
"Reverse APIs" as they provide what is required for API specification, and the developer should create an API to use a webhook.
A webhook is an API concept that is also used to send text messages and notifications to mobile numbers or email addresses from an application when a specific event is triggered. For instance, if you search for something in the online store and the required item is out of stock, you click on the "Notify me" bar to get an alert from the application when that item is available for purchase. These notifications from the applications are usually sent through webhooks.

NEW QUESTION # 262
A large company intends to use BlackBerry for corporate mobile phones and a security analyst is assigned to evaluate the possible threats. The analyst will use the Blackjacking attack method to demonstrate how an attacker could circumvent perimeter defenses and gain access to the corporate network. What tool should the analyst use to perform a Blackjacking attack?

- A. BBCrack
- B. BBProxy
- C. Blooover

- D. Paros Proxy

Answer: B

Explanation:
The Blackjacking attack involves leveraging a compromised BlackBerry device and its connection through the BlackBerry Enterprise Server (BES) to tunnel back into the internal corporate network, bypassing perimeter firewalls. The tool used in this method is BBProxy.
BBProxy is installed on the BlackBerry device and establishes a covert tunnel via BES, allowing attackers to pivot into the internal LAN from outside the perimeter.
Reference - CEH v13 Official Study Guide:
Module 17: Hacking Mobile Platforms
Quote:
"Blackjacking is a technique in which attackers use BBProxy to exploit a trusted path from a BlackBerry device to the corporate LAN through BES." Incorrect Options Explained:
A). Paros Proxy is a web proxy used for intercepting HTTP/S traffic.
C). Blooover is used for Bluetooth security auditing.
D). BBCrack is used for password recovery on BlackBerry devices, not for tunneling.
=

NEW QUESTION # 263
.....

The software version is one of the three versions of our 312-50v13 actual exam, which is designed by the experts from our company. The functions of the software version are very special. For example, the software version can simulate the real exam environment. If you buy our 312-50v13 study questions, you can enjoy the similar real exam environment. So do not hesitate and buy our 312-50v13 preparation exam, you will benefit a lot from our products.
