Certification Identity-and-Access-Management-Architect Book Torrent & Test Identity-and-Access-Management-Architect Questions Pdf

In order to serve you better, we have a complete system for you if you choose us. We have free demo for Identity-and-Access-

Management-Architect training materials for you to have a try. If you have decided to buy Identity-and-Access-Management-Architect exam dumps of us, just add them to your cart, and pay for it, our system will send the downloading link and password to you within ten minutes, and if you don't receive, just contact us, we will solve this problem for you as quickly as possible. For Identity-and-Access-Management-Architect Training Materials, we also have after-service, if you have questions about the exam dumps, you can contact us by email.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q239-Q244):

NEW QUESTION # 239
Universal containers (UC) have a custom, internal-only, mobile billing application for users who are commonly out of the office. The app is configured as a connected App in salesforce. Due to the nature of this app, UC would like to take the appropriate measures to properly secure access to the app. Which two are recommendations to make the UC? Choose 2 answers

- A. Set login IP ranges to the internal network for all of the app users profiles.
- B. Use Google Authenticator as an additional part of the logical processes.
- C. Disallow the use of single Sign-on for any users of the mobile app.
- D. Require high assurance sessions in order to use the connected App

Answer: B,D

Explanation:
High assurance sessions are sessions that require a stronger level of identity verification, such as two-factor authentication or SAML assertions1. Google Authenticator is an app that generates verification codes on your mobile device that you can use as a second factor of authentication2. These measures can help prevent unauthorized access to the connected app by ensuring that the user is who they claim to be and that they have access to their mobile device. Disallowing the use of single sign-on (SSO) for the mobile app is not a recommendation because SSO can provide a seamless and secure user experience across multiple applications3. Setting login IP ranges to the internal network for the app users profiles is not a recommendation because it can limit the mobility and flexibility of the users who are commonly out of the office.

NEW QUESTION # 240
Universal Containers (UC) has a mobile application for its employees that uses data from Salesforce as well as uses Salesforce for Authentication purposes. UC wants its mobile users to only enter their credentials the first time they run the app. The application has been live for a little over 6 months, and all of the users who were part of the initial launch are complaining that they have to re-authenticate. UC has also recently changed the URI Scheme associated with the mobile app. What should the Architect at UC first investigate?Universal Containers (UC) has a mobile application for its employees that uses data from Salesforce as well as uses Salesforce for Authentication purposes. UC wants its mobile users to only enter their credentials the first time they run the app. The application has been live for a little over 6 months, and all of the users who were part of the initial launch are complaining that they have to re-authenticate. UC has also recently changed the URI Scheme associated with the mobile app. What should the Architect at UC first investigate?

- A. Verify that the Callback URL is correctly pointing to the new URI Scheme.
- B. Confirm that the access Token's Time-To-Live policy has been set appropriately.
- C. Check the Refresh Token policy defined in the Salesforce Connected App.
- D. Validate that the users are checking the box to remember their passwords.

Answer: C

Explanation:
Explanation
The first thing that the architect at UC should investigate is the refresh token policy defined in the Salesforce connected app. A refresh token is a credential that allows an application to obtain new access tokens without requiring the user to re-authenticate. The refresh token policy determines how long a refresh token is valid and under what conditions it can be revoked. If the refresh token policy is set to expire after a certain period of time or after a change in IP address or device ID, then the users may have to re-authenticate after using the app for a while or from a different location or device. Option B is not a good choice because validating that the users are checking the box to remember their passwords may not be relevant, as the app uses SSO with a third-party identity provider and does not rely on Salesforce credentials. Option C is not a good choice because verifying that the callback URL is correctly pointing to the new URI scheme may not be necessary, as the callback URL is used for redirecting the user back to the app after authentication, but it does not affect how long the user can stay authenticated. Option D is not a good choice because

confirming that the access token's time-to-live policy has been set appropriately may not be effective, as the access token's time-to-live policy determines how long an access token is valid before it needs to be refreshed by a refresh token, but it does not affect how long a refresh token is valid or when it can be revoked. NEW QUESTION # 241
Northern Trail Outfitters (NTO) is launching a new sportswear brand on its existing consumer portal built on Salesforce Experience Cloud. As part of the launch, emails with promotional links will be sent to existing customers to log in and claim a discount. The marketing manager would like the portal dynamically branded so that users will be directed to the brand link they clicked on; otherwise, users will view a recognizable NTO-branded page.
The campaign is launching quickly, so there is no time to procure any additional licenses. However, the development team is available to apply any required changes to the portal.
Which approach should the identity architect recommend?

- A. Use Heroku to build the new brand site and embedded login to reuse identities.
- B. Configure an additional community site on the same org that is dedicated for the new brand.
- C. Create a full sandbox to replicate the portal site and update the branding accordingly.
- D. Implement Experience ID in the code and extend the URLs and endpoints, as required.

Answer: D

NEW QUESTION # 242
Universal Containerswants to implement Single Sign-on for a Salesforce org using an external Identity Provider and corporate identity store.
What type of authentication flow is required to support deep linking'

- A. Web Server OAuth SSO flow
- B. Service-Provider-Initiated SSO
- C. Identity-Provider-initiated SSO
- D. StartURL on Identity Provider

Answer: B

Explanation:
Single sign-on (SSO) is an authentication method that enables users to access multiple applications with one login and one set of credentials4. There are two types of SSO flows thatcan be used with Salesforce as the service provider (SP) and an external identity provider(IdP)5:
* Service-provider-initiated SSO: The user requests a resource fromthe SP, such as a Salesforce URL.
The SP redirects the user to the IdP for authentication. The IdP authenticates the user and sends a SAML response to the SP. The SP validates the SAML response and grants access to the user5. This type of SSO flowsupports deep linking, which means that the user can access a specific page within Salesforce without logging in again6.
* Identity-provider-initiated SSO: The user logs in to the IdP and selects an app froma list of available apps. The IdP sends a SAML response to the SP. The SP validates the SAML response and grants access to the user5. This type of SSO flow does not support deep linking, which means that the user can only access the default landing page of Salesforce6.

NEW QUESTION # 243
Universal Containers (UC) currently uses Salesforce Sales Cloud and an external billing application. Both Salesforce and the billing application are accessed several times a day to manage customers. UC would like to configure single sign-on and leverage Salesforce as the identity provider. Additionally, UC would like the billing application to be accessible from Salesforce. A redirect is acceptable.
Which two Salesforce tools should an identity architect recommend to satisfy the requirements?
Choose 2 answers

- A. Identity Connect
- B. Connected Apps
- C. App Launcher
- D. salesforce Canvas

Answer: C,D

Explanation:
Explanation
Salesforce Canvas is a tool that allows external applications to be embedded into Salesforce as iframes, which can provide a seamless user experience. App Launcher is a feature that allows users to access connected apps from a single location in Salesforce. To enable single sign-on and use Salesforce as the identity provider, the external billing application needs to be configured as a connected app and use an OAuth 2.0 or SAML protocol. Identity Connect is not relevant for this scenario, as it is a tool for synchronizing user data between Salesforce and Active Directory.
