Google certification Associate-Cloud-Engineer exams has become more and more popular in the fiercely competitive IT industry. Although more and more people sign up to attend this examination of, the official did not reduce its difficulty and it is still difficult to pass the exam. After all, this is an authoritative test to inspect the computer professional knowledge and information technology ability. In order to pass the Google Certification Associate-Cloud-Engineer Exam, generally, many people need to spend a lot of time and effort to review.

To take the ACE exam, candidates should have a good understanding of the fundamentals of cloud computing and GCP. This includes knowledge of GCP products and services, such as Compute Engine, App Engine, and Kubernetes Engine, as well as experience in deploying applications and managing solutions in cloud environments. Candidates should also be familiar with GCP security features and best practices for managing data and resources on GCP.

Google Associate-Cloud-Engineer (Google Associate Cloud Engineer) Certification Exam is designed for individuals who want to demonstrate their understanding of Google Cloud Platform (GCP) and their ability to deploy, manage, and operate applications on GCP. Google Associate Cloud Engineer Exam certification is ideal for IT professionals who are responsible for managing and deploying applications on cloud platforms. Associate-Cloud-Engineer Exam Tests your knowledge of GCP services, networking, security, and application deployment.

Prerequisites

The certification test has no formal prerequisites. However, hands-on experience with Google Cloud will be a benefit. The candidates are recommended to have at least 6 months of practical experience in the domain of the Google Associate Cloud Engineer exam. In addition, the applicants need to develop an in-depth understanding of the topics covered in the test.

Perfect Google Online Associate-Cloud-Engineer Tests Are Leading Materials & Trusted Instant Associate-Cloud-Engineer Access

Test4Engine have a strong IT expert team to constantly provide you with an effective training resource. They continue to use their rich experience and knowledge to study the real exam questions of the past few years. Finally Test4Engine's targeted practice questions and answers have advent, which will give a great help to a lot of people participating in the IT certification exams. You can free download part of Test4Engine's simulation test questions and answers about Google Certification Associate-Cloud-Engineer Exam as a try. Through the proof of many IT professionals who have use Test4Engine's products, Test4Engine is very reliable for you. Generally, if you use Test4Engine's targeted review questions, you can 100% pass Google certification Associate-Cloud-Engineer exam. Please Add Test4Engine to your shopping cart now! Maybe the next successful people in the IT industry is you.

Google Associate Cloud Engineer Exam Sample Questions (Q255-Q260):

NEW QUESTION # 255

You have deployed an application on a single Compute Engine instance. The application writes logs to disk. Users start reporting errors with the application. You want to diagnose the problem. What should you do?

- A. Navigate to Cloud Logging and view the application logs.
- B. Install and configure the Cloud Logging Agent and view the logs from Cloud Logging.
- C. Connect to the instance's serial console and read the application logs.
- D. Configure a Health Check on the instance and set a Low Healthy Threshold value.

Answer: A

Explanation:

Activity logging is enabled by default for all Compute Engine projects.

You can see your project's activity logs through the Logs Viewer in the Google Cloud Console:

In the Cloud Console, go to the Logging page.

Go to the Logging page

When in the Logs Viewer, select and filter your resource type from the first drop-down list.

From the All logs drop-down list, select `compute.googleapis.com/activity_log` to see Compute Engine activity logs.

https://cloud.google.com/compute/docs/logging/activity-logs#viewing_logs Besides:

Activity logs are provided as part of the Cloud Logging service. For more information about Logging in general, read the Cloud Logging documentation.

<https://cloud.google.com/compute/docs/logging/activity-logs>

NEW QUESTION # 256

Your customer has implemented a solution that uses Cloud Spanner and notices some read latency-related performance issues on one table. This table is accessed only by their users using a primary key. The table schema is shown below.

```
CREATE TABLE Persons (  
  person_id INT64 NOT NULL,      // sequential number based on number of registration  
  account_creation_date DATE,    // system date  
  birthdate DATE,               // customer birthdate  
  firstname STRING (255),       // first name  
  lastname STRING (255),        // last name  
  profile_picture BYTES (255)    // profile picture  
) PRIMARY KEY (person_id)
```

You want to resolve the issue. What should you do?

- A. Remove the `profile_picture` field from the table.
- B. Add a secondary index on the `person_id` column.
- C. Change the primary key to not have monotonically increasing values.
- D. Create a secondary index using the following Data Definition Language (DDL):

```
CREATE INDEX person_id_ix  
ON Persons (  
  person_id,  
  firstname,  
  lastname  
) STORING (  
  profile_picture  
)
```

- A. Option A
- B. Option C
- C. Option D
- D. Option B

Answer: B

Explanation:

As mentioned in Schema and data model, you should be careful when choosing a primary key to not accidentally create hotspots in your database. One cause of hotspots is having a column whose value monotonically increases as the first key part, because this

results in all inserts occurring at the end of your key space. This pattern is undesirable because Cloud Spanner divides data among servers by key ranges, which means all your inserts will be directed at a single server that will end up doing all the work.
<https://cloud.google.com/spanner/docs/schema-design#primary-key-prevent-hotspots>

NEW QUESTION # 257

You deployed a new application inside your Google Kubernetes Engine cluster using the YAML file specified below.

```
apiVersion: apps/v1          apiVersion: v1
kind: Deployment             kind: Service
metadata:                   metadata:
  name: myapp-deployment     name: myapp-service
spec:                       spec:
  selector:                 ports:
    matchLabels:             - port: 8000
      app: myapp             targetPort: 80
  replicas: 2               protocol: TCP
  template:                 selector:
    metadata:                app: myapp
    labels:
      app: myapp
    spec:
      containers:
        - name: myapp
          image: myapp:1.1
          ports:
            - containerPort: 80
```

You check the status of the deployed pods and notice that one of them is still in PENDING status:

```
kubectl get pods -l app=myapp
```

NAME	READY	STATUS	RESTART	AGE
myapp-deployment-58ddb995-lp86m	0/1	Pending	0	9m
myapp-deployment-58ddb995-qjpkg	1/1	Running	0	9m

You want to find out why the pod is stuck in pending status. What should you do?

- A. Review details of the myapp-deployment Deployment object and check for error messages.
- B. Review details of myapp-deployment-58ddb995-lp86m Pod and check for warning messages.
- C. View logs of the container in myapp-deployment-58ddb995-lp86m pod and check for warning messages.
- D. Review details of the myapp-service Service object and check for error messages.

Answer: B

NEW QUESTION # 258

You have an application that uses Cloud Spanner as a database backend to keep current state information about users. Cloud Bigtable logs all events triggered by users. You export Cloud Spanner data to Cloud Storage during daily backups. One of your analysts asks you to join data from Cloud Spanner and Cloud Bigtable for specific users. You want to complete this ad hoc request as efficiently as possible. What should you do?

- A. Create a dataflow job that copies data from Cloud Bigtable and Cloud Spanner for specific users.
- B. Create a dataflow job that copies data from Cloud Bigtable and Cloud Storage for specific users.

- C. Create a Cloud Dataproc cluster that runs a Spark job to extract data from Cloud Bigtable and Cloud Storage for specific users.
- D. Create two separate BigQuery external tables on Cloud Storage and Cloud Bigtable. Use the BigQuery console to join these tables through user fields, and apply appropriate filters.

Answer: A

NEW QUESTION # 259

You have experimented with Google Cloud using your own credit card and expensed the costs to your company. Your company wants to streamline the billing process and charge the costs of your projects to their monthly invoice. What should you do?

- **A. Change the billing account of your projects to the billing account of your company.**
- B. Grant the financial team the IAM role of Billing Account User'S on the billing account linked to your credit card.
- C. Set up BigQuery billing export and grant your financial department IAM access to query the data.
- D. Create a ticket with Google Billing Support to ask them to send the invoice to your company.

Answer: A

NEW QUESTION # 260

.....

As a key to the success of your life, the benefits that our Associate-Cloud-Engineer study braindumps can bring you are not measured by money. Associate-Cloud-Engineer exam questions can not only help you pass the exam, but also help you master a new set of learning methods and teach you how to study efficiently, our Associate-Cloud-Engineer Study Materials will lead you to success. And Associate-Cloud-Engineer study materials provide free trial service for consumers. Come and have a try!
