HOT Valid Mule-Dev-202 Test Guide - Trustable Salesforce Salesforce Certified MuleSoft Hyperautomation Developer - Latest Test Mule-Dev-202 Simulations

Mule-Dev-202 practice test material is in line with the content of the actual Salesforce Mule-Dev-202 certification test. Before buying Mule-Dev-202 exam dumps, you can test its features with a free demo. If you get help from updated Mule-Dev-202 questions, you can easily clear the Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) test in one go. After

receiving input from thousands of professionals worldwide, ActualTestsQuiz has developed its Mule-Dev-202 exam study material. After making a payment, clients will get up to three months of free Salesforce Mule-Dev-202 exam questions updates as well.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which component of Anypoint Platform is responsible for enforcing API policies?

- A. API Runtime
- B. API Manager
- C. API Gateway
- D. API Analytics

Answer: C

Explanation:

The component of Anypoint Platform responsible for enforcing API policies is the API Gateway:

API Gateway:

The API Gateway is a runtime component that enforces policies applied to APIs. It acts as an intermediary that manages API traffic, security, and performance by applying the policies configured in API Manager.

Policies such as rate limiting, security, transformation, and monitoring are enforced at the API Gateway to ensure that APIs are accessed securely and efficiently.

NEW QUESTION # 55

What is the difference between Run and Debug modes in Flow Builder?

- A. Debug mode uses AI to fix any bugs in the flow.
- B. Debug mode displays details for debugging the flow.
- C. Run mode uses the latest version of the flow.
- D. Run mode is only available for active flows.

Answer: B

Explanation:

In Flow Builder, Run and Debug modes have distinct functionalities:

Run Mode:

Executes the flow as it is, allowing you to see the end-to-end execution based on the latest saved version.

Typically used to verify that the flow works as expected under normal conditions.

Debug Mode:

Provides detailed information for each step of the flow, including input and output data, and any errors encountered.

Useful for troubleshooting and identifying issues within the flow, allowing developers to understand how the flow executes and where problems may arise.

Debug mode is specifically designed to aid in diagnosing and fixing issues by providing a granular view of the flow's execution.

NEW QUESTION # 56

AnyAirlines needs to automatically sync Salesforce accounts with NetSuite customers using a MuleSoft Composer flow. The Address field in the Salesforce Account object is a compound field consisting of the simple fields: Street, City, State, Zip, and Country.

However, the Address field in the NetSuite Customer entity is a list consisting of the simple fields: Street, City, State, Zip, and Country.

Which task must be performed to map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite Address list in the flow?

- A. Break up the NetSuite Address list into fields that match Salesforce address-related fields using a custom formula field in NetSuite.
- **B. Combine the Salesforce address-related fields into a list using a custom expression in Composer.**
- C. Combine the Salesforce address-related fields into a list using the Get records action in Composer.
- D. Combine the Salesforce address-related fields into a list using a custom formula field in Salesforce.

Answer: B

Explanation:

To map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite Address list in MuleSoft Composer, you need to perform the following task:

Custom Expression in Composer:

Use a custom expression in MuleSoft Composer to combine the individual address-related fields from Salesforce (Street, City, State, Zip, Country) into a format that matches the NetSuite Address list.

This custom expression will concatenate the individual simple fields from Salesforce into a structured format that can be mapped directly to the NetSuite Address list.

Mapping the Fields:

Once the custom expression is created, map the resulting list to the corresponding fields in the NetSuite Customer entity within the Composer flow.

This ensures that each simple field in the Salesforce compound Address field is correctly mapped to the respective field in the NetSuite Address list.

NEW QUESTION # 57

The current date and time is September 28, 2022, at 9:00 a.m.

A process running in a single Secured Session is scheduled to start September 28, 2022, at 10:00 a.m., and run every 45 minutes.

If the process takes one hour to complete when it runs for the first time, when will it run for the second time?

- A. September 28, 2022, at 10:30 a.m.
- **B. After the first execution is complete**
- C. September 28, 2022, at 10:45 a.m.
- D. September 28, 2022, at 11:30 a.m.

Answer: B

Explanation:

The process running in a single Secured Session is scheduled to start at 10:00 a.m. and run every 45 minutes.

If the process takes one hour to complete the first time, it will start the next run only after the current execution finishes because it's within a single secured session:

First Run:

Scheduled to start at 10:00 a.m.

Takes 1 hour to complete, finishing at 11:00 a.m.

Next Run:

Since the first run takes 1 hour, the next execution can only start after the first one completes.

The subsequent run will then start 45 minutes after the completion of the first run, which is at 11:00 a.m. + 45 minutes = 11:45 a.m.

So, the process will run for the second time at 11:45 a.m.

NEW QUESTION # 58

A non-technical employee from AnyAirlines creates a hyperautomation solution. The solution needs to meet the following criteria:

The process needs to begin when a record is created in Salesforce.

Then, it needs to pass data to a pre-existing RPA process which includes a User Task for data integrity purposes.

The output of the RPA process needs to be used to create a record in NetSuite.

According to best practices, how should this automated process be structured?

- A. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process.2. Then, a second MuleSoft Composer flow triggers when the RPA process is completed and creates a record in NetSuite.

- B. 1. A Salesforce flow triggers on the creation of the record and makes an outbound request to a MuleSoft Composer flow.2. Then, the same MuleSoft Composer flow calls the RPA process and uses the result to create a record in NetSuite.
- C. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process.2. Then, the same flow uses the response to create a record in NetSuite.B 1. A Salesforce flow triggers on the creation of the record and calls too RPA process.2. Then, the same flow uses the response to create a record in NetSuite.

Answer: C

Explanation:

To structure the automated process to meet the given criteria, the following approach is recommended:

MuleSoft Composer Flow Triggers on Record Creation:

Use MuleSoft Composer to create a flow that is triggered when a new record is created in Salesforce. This is done by setting up a trigger event in MuleSoft Composer that listens for new record creation events in Salesforce.

Call the RPA Process:

Once the flow is triggered, it should call the pre-existing RPA process. MuleSoft Composer can invoke MuleSoft RPA bots, and you can pass the necessary data from the Salesforce record to the RPA process.

The RPA process will include the User Task for data integrity purposes.

Use the RPA Process Output to Create a Record in NetSuite:

After the RPA process completes, the MuleSoft Composer flow can capture the output from the RPA process.

The same MuleSoft Composer flow will then use this output to create a record in NetSuite, ensuring a seamless data transfer and process automation.
