

Integration-Architect New Exam Bootcamp | Reliable Integration-Architect Exam Answers

P.S. Free & New Integration-Architect dumps are available on Google Drive shared by PassLeader: https://drive.google.com/open?id=1I9s98Z6t_v_UqVLfBot3ohocox4RjOzE

The Salesforce Certified Integration Architect prep torrent that we provide is compiled elaborately and highly efficient. You only need 20-30 hours to practice our Integration-Architect exam torrent and then you can attend the exam. For most of our customers, who are busy with their jobs or other things. But if they use our Integration-Architect test prep, they won't need so much time to prepare the exam and master exam content in a short time. What they need to do is just to spare 1-2 hours to learn and practice every day and then pass the exam with Integration-Architect Test Prep easily. It costs them little time and energy to pass the exam.

Salesforce Integration-Architect Certification consists of a rigorous exam that tests the knowledge and skills of professionals in the area of Salesforce integration. Integration-Architect exam covers a wide range of topics, including data integration, application integration, and enterprise integration. Professionals who pass the exam are considered experts in the area of Salesforce integration and are highly valued by employers.

Salesforce Integration-Architect certification is a highly sought-after credential among experienced Salesforce professionals. Salesforce Certified Integration Architect certification demonstrates that the candidate has the skills and knowledge necessary to lead integration projects and ensure successful outcomes. It also validates the candidate's expertise in various integration patterns, technologies, and tools. Salesforce Certified Integration Architect certification exam covers a wide range of topics, including integration architecture, data modeling, API design, security, and performance tuning.

Free PDF 2026 Salesforce Updated Integration-Architect: Salesforce Certified Integration Architect New Exam Bootcamp

In order to let you understand our products in detail, our Integration-Architect test torrent has a free trail service for all customers. You can download the trail version of our Integration-Architect study torrent before you buy our products, you will develop a better understanding of our products by the trail version. In addition, the buying process of our Integration-Architect Exam Prep is very convenient and significant. You will receive the email from our company in 5 to 10 minutes after you pay successfully; you just need to click on the link and log in, then you can start to use our Integration-Architect study torrent for studying.

Salesforce Certified Integration Architect certification exam is a rigorous exam that requires in-depth knowledge of integration patterns, integration architecture, data migration, and data synchronization. Integration-Architect Exam covers a wide range of

topics, including middleware technologies, RESTful APIs, SOAP APIs, and ETL tools. Candidates are expected to have hands-on experience in designing, implementing, and managing complex integrations in a real-world environment.

Salesforce Certified Integration Architect Sample Questions (Q37-Q42):

NEW QUESTION # 37

Which Web Services Description Language (WSDL) should an architect consider when creating an integration that might be used for more than one Salesforce org and different metadata?

- A. Enterprise WSDL
- B. SOAP API WSDL
- C. Partner WSDL

Answer: C

Explanation:

In the world of Salesforce SOAP APIs, the choice of WSDL depends on the nature of the application being built. When an architect needs to build an integration that is org-agnostic-meaning it can work across multiple different Salesforce organizations with varying custom objects and fields-the Partner WSDL is the correct choice.

The Partner WSDL is loosely-typed. It does not contain information about an org's specific custom metadata; instead, it uses a generic sObject structure. This allows a single client application (like a third-party integration tool or a mobile app) to connect to any Salesforce org and dynamically discover its schema at runtime. Because it is not tied to a specific org's metadata, it does not need to be regenerated every time a custom field is added to one of the target orgs.

In contrast, Option A (Enterprise WSDL) is strongly-typed. It is generated specifically for one org and contains hard-coded references to that org's custom objects and fields. While this provides better compile-time safety for internal, single-org integrations, it is unsuitable for an application intended for "more than one Salesforce org" because the WSDL would be invalid for any org that doesn't have the exact same metadata.

Option C is a general term; the actual choices provided by Salesforce for integration are the Partner or Enterprise WSDLs. Therefore, for maximum flexibility and reusability across a multi-org landscape, the Partner WSDL is the industry standard.

NEW QUESTION # 38

Northern Trail Outfitters (NTO) has recently implemented middleware for orchestration of services across platforms. The ERP system being used requires transactions be captured near real time at a REST endpoint initiated in Salesforce when creating an order object. Additionally, the Salesforce team has limited development resources and requires a low code solution.

Which two options will fulfill the use case requirements?

Choose 2 answers

- A. Implement Change Data Capture on the order object and leverage the replay Id in the middleware solution.
- B. Use a process builder to create a Platform Event, selecting the record type as the Platform Event Name on insert of record.
- C. Use Remote Process Invocation fire and forget pattern on insert on the order object using Flow Builder.
- D. Implement a Workflow Rule with Outbound Messaging to send SOAP messages to the designated endpoint.

Answer: A,C

Explanation:

Answer A is valid because the Remote Process Invocation fire and forget pattern allows sending a message from Salesforce to the ERP system without waiting for a response or acknowledgement. This enables near real-time integration and reduces the latency and complexity of the integration. The Flow Builder is a low code tool that can be used to invoke an Apex action that makes the HTTP callout to the REST endpoint on insert of the order object. Answer C is valid because the Change Data Capture feature allows capturing changes in Salesforce data and publishing them as events to a streaming channel. The middleware can subscribe to the channel and receive the events that contain the order details. The replay Id is a unique identifier for each event that can be used by the middleware to resume from the last processed event in case of failures or interruptions. This ensures reliable and consistent integration between Salesforce and the ERP system. Answer B is not valid because the Outbound Messaging feature uses SOAP messages to send notifications to external systems based on workflow rules. This requires configuring a SOAP endpoint and a WSDL file for the ERP system, which may not be compatible with the REST endpoint requirement. Moreover, Outbound Messaging does not guarantee delivery or order of messages, which may affect the accuracy and timeliness of the integration. Answer D is not valid because the Platform Event feature allows publishing custom events from Salesforce to external systems or vice versa using a publish/subscribe model. However, this requires creating a platform event object and defining its fields and permissions, which may not be a low code solution. Moreover, using the record type as the platform event name may not be a valid or meaningful option, as record types are used to define different business processes or user interfaces for an object.

1:Remote Process Invocation-Fire and Forget 2: Invoke an Apex Class That Makes a Callout 3: Change Data Capture : Replay Events Using Middleware : Outbound Messaging Implementation Guide : Platform Events Developer Guide

NEW QUESTION # 39

Northern Trail Outfitters (NTO) has recently changed their Corporate Security Guidelines. The guidelines require that all cloud applications pass through a secure firewall before accessing on-premise resources. NTO is evaluating middleware solutions to integrate cloud applications with on-premise resources and services.

What are two considerations an Integration Architect should evaluate before choosing a middleware solution?

Choose 2 answers

- A. The middleware solution is able to interface directly with databases via an ODBC connection string.
- B. The middleware solution enforces the OAuth security protocol.
- C. The middleware solution is capable of establishing a secure API gateway between cloud applications and on-premise resources.
- D. An API gateway component is deployable behind a Demilitarized Zone (DMZ) or perimeter network.

Answer: C,D

NEW QUESTION # 40

A company that is a leading provider of training delivers courses to students globally. The company decided to use customer community in order to allow Studer to log in to the community, register for courses and pay course fees. The company has a payment gateway that takes more than 30 seconds to process the pays transaction. Students would like to get the payment result in real-time so in case an error happens, the students can retry the payment process.

What is the recommended integration approach to process payments based on this requirement?

- A. Use request and reply to make an API call to the payment gateway.
- B. Use continuation to process payment to the payment gateway.C Use change data capture to process payment to the payment gateway.
- C. Use platform event to process payment to the payment gateway.

Answer: B

Explanation:

Explanation

The continuation class in Apex allows you to make long-running requests to external web services and process their responses in a callback method. This is useful for scenarios where the response time exceeds the normal Apex limits, such as 10 seconds for synchronous transactions or 120 seconds for asynchronous transactions. By using continuation, you can avoid hitting these limits and provide a better user experience! References: Callout Limits and Limitations

NEW QUESTION # 41

Northern Trail Outfitters needs to use Shield Platform Encryption to encrypt social security numbers in order to meet a business requirement.

Which two considerations should an Integration Architect do prior to the implementation of Shield Platform Encryption?

Choose 2 answers

- A. Review shield platform encryption configurations.
- B. Encrypt all the data so that it is secure.
- C. Use Shield Platform Encryption as a user authentication or authorization tool.
- D. Encrypt the data using the most current key.

Answer: A,B

Explanation:

The considerations that an Integration Architect should do prior to the implementation of Shield Platform Encryption are:

Review shield platform encryption configurations.

Encrypt all the data so that it is secure.

Shield Platform Encryption is a feature that allows you to encrypt sensitive data at rest in Salesforce, such as social security numbers, without compromising critical platform functionality. Before implementing Shield Platform Encryption, you should review the shield

platform encryption configurations, such as the encryption key management, the encryption policy, and the encrypted fields and files. You should also encrypt all the data that is subject to encryption, not just the data using the most current key. Encrypting all the data ensures that your data is secure and compliant with your business requirements. Encrypting the data using the most current key is not a valid consideration because Shield Platform Encryption uses a deterministic encryption scheme that does not allow you to rotate or re-encrypt your data with a new key. Using Shield Platform Encryption as a user authentication or authorization tool is not a valid consideration because Shield Platform Encryption is not designed for that purpose. Shield Platform Encryption only encrypts data at rest, not in transit or in use.
