If you require any further information about either our Integration-Architect preparation exam or our corporation, please do not hesitate to let us know. High quality Integration-Architect practice materials leave a good impression on the exam candidates and bring more business opportunities in the future. And many of our customers use our Integration-Architect Exam Questions as their exam assistant and establish a long cooperation with us.

Salesforce Integration-Architect Certification Exam is a proctored exam that consists of 60 multiple-choice questions. Integration-Architect exam duration is 120 minutes, and candidates must score at least 67% to pass the exam. Integration-Architect exam fee is \$400, and candidates can take the exam at a proctored testing center or online.

Salesforce Integration-Architect certification exam is one of the most sought-after certifications for professionals in the IT industry. It is a certification that validates your skills and knowledge in designing and implementing complex integrations between Salesforce and other third-party systems. Salesforce Certified Integration Architect certification is designed for architects, developers, and technical leads who are responsible for designing and implementing integrations.

Pass Guaranteed 2026 Salesforce Accurate New Integration-Architect Test Labs

As we all know, it is a must for all of the candidates to pass the exam if they want to get the related Integration-Architect certification which serves as the best evidence for them to show their knowledge and skills. If you want to simplify the preparation process, here comes a piece of good news for you. Our Integration-Architect Exam Question has been widely praised by all of our customers in many countries and our company has become the leader in this field. Now I would like to give you some detailed information about the advantages of our Integration-Architect guide torrent.

Salesforce Certified Integration Architect Sample Questions (Q112-Q117):

NEW QUESTION # 112

Northern Trail Outfitters (NTO) has an affiliate company that would like immediate notifications of changes to opportunities in the NTO Salesforce instance. The affiliate company has a CometD client available.

Which solution is recommended in order to meet the requirement?

- A. Create a connected app in the affiliate org and select the "Accept CometD API Requests".
- B. **Create a PushTopic update event on the Opportunity Object to allow the subscriber to react to the streaming API.**
- C. Implement a polling mechanism in the client that calls the SOAP API getupdated method to get the ID values of each updated record.
- D. Configure External Services to call the subscriber in Apex in the Onchange Trigger event as part of the flow.

Answer: B

NEW QUESTION # 113

An integration architect has received a request to prevent employees that leave the company from accessing data in Salesforce after they are deactivated in the company's HR system.

What should the integration architect determine before recommending a solution?

- A. **Data access prevention requirements, then identify frequency**
- B. Inbound integration requirements, then identify frequency
- C. Data access prevention requirements, integration requirements, and system constraints

Answer: A

NEW QUESTION # 114

An integration developer is developing an HR synchronization app for a client. The app synchronizes Salesforce record data changes with an HR system that's external to Salesforce. What should the integration architect recommend to ensure notifications are stored for up to 3 days if data replication fails?

- A. Callouts
- B. **Change Data Capture**
- C. Outbound Message

Answer: B

Explanation:

For HR synchronization requiring high reliability and a multi-day data retention window, Change Data Capture (CDC) is the optimal architectural choice.12 CDC is an event-driven integration framework that automatically publishes change events for Salesforce records (Create, Update, Delete, and Undelete). A critical feature of CDC for failure recovery is its 72-hour (3-day) retention window. If the external HR system or the replication middleware experience downtime, the change events remain stored in the Salesforce event bus for up to three days. Once the HR system is back online, the subscriber can use the Replay ID of the last successfully processed event to retrieve all missed notifications from the bus, ensuring zero data loss during the outage.

In contrast, Outbound Messaging (Option B) only provides a 24-hour retry window. If the target system is unavailable for more than one day, the notifications are dropped, making it unsuitable for a 3-day requirement. Callouts (Option C) are typically synchronous and do not have native, platform-managed storage or retry mechanisms for failed requests; once a callout fails, the data is lost unless a custom retry architecture is built. CDC's native, durable event bus provides the necessary scalability and resilience for critical HR data synchronization without requiring complex custom code for error handling and data recovery.

NEW QUESTION # 115

A customer of Salesforce has used Platform Events to integrate their Salesforce instance with an external third-party Artificial Intelligence (AI) system. The AI system provides a prediction score for each lead that is received by Salesforce. Once the prediction score is received, the lead information is saved to Platform events for other processes. The trigger on the Platform Events is failing once this was rolled out to Production.

What type of monitoring should the Integration Consultant have considered to monitor this integration?

- A. Monitor Platform Events created per hour limits across the Salesforce instance.
- B. Validate the Platform Event definition matches leads definition.
- C. Set up debug logs for Platform Event triggers to monitor performance.
- D. Monitor the volume of leads that are created in Salesforce.

Answer: A

Explanation:

The integration consultant should have considered monitoring the Platform Events created per hour limits across the Salesforce instance. This is because Platform Events have a limit on the number of events that can be published or delivered per hour, depending on the edition and license type. If this limit is exceeded, the trigger on the Platform Events may fail or be delayed. Option B is not correct because debug logs for Platform Event triggers are not useful for monitoring performance. Debug logs are used for troubleshooting issues or errors in the trigger logic, not for measuring the throughput or latency of the events. Option C is not correct because validating the Platform Event definition matches leads definition is not a monitoring task, but a design task. The integration consultant should have ensured that the Platform Event definition matches leads definition before deploying the integration to production. Option D is not correct because monitoring the volume of leads that are created in Salesforce is not relevant for this integration. The volume of leads does not affect the trigger on the Platform Events, as long as the Platform Events created per hour limits are not exceeded.

NEW QUESTION # 116

Salesforce is the system of record for Leads, Contacts, Accounts, and Cases. Customer data also exists in an ERP, ticketing system, and data lake, each with unique identifiers. Middleware is used to update systems bidirectionally. Which solution should be recommended to handle this?

- A. Use Change Data Capture to update downstream systems accordingly.
- B. Locally cache external IDs at the middleware layer.
- C. Design an MDM solution that maps external IDs to the Salesforce record ID.

Answer: C

Explanation:

In a complex landscape where multiple systems contain overlapping customer data, each with its own primary key, the core architectural challenge is Identity Management. To ensure that an update in Salesforce (the System of Record) correctly updates "Customer A" in the ERP and "Customer A" in the Data Lake, a Master Data Management (MDM) strategy is required.

An MDM solution creates a Cross-Reference (X-Ref) Table or a "Golden Record" that maps the unique identifiers from all systems. In the Salesforce record, the architect should implement External ID fields for each corresponding system (e.g., ERP_ID_c, Ticket_System_ID_c).

Why this is the superior recommendation:

* Bidirectional Integrity: When the middleware receives an update from the ERP, it uses the ERP_ID_c to perform an "upsert" in Salesforce, ensuring no duplicates are created.

* Traceability: It allows for easy auditing of data lineage across the enterprise.

* Decoupling: Salesforce doesn't need to know the internal logic of the ERP; it simply holds the reference key.

Option B (CDC) is a delivery mechanism, not an identity management strategy; it tells you that something changed, but not which record in the ERP it corresponds to without the ID mapping. Option C (Local caching in middleware) is an "anti-pattern" because it makes the middleware stateful; if the middleware cache is lost or out of sync, the entire integration breaks. By designing an MDM-based mapping solution directly within the data model, the architect ensures a robust, scalable, and transparent identity framework for the entire enterprise.

NEW QUESTION # 117

.....

There are a lot of leading experts and professors in different field in our company. The first duty of these leading experts and professors is to compile the Integration-Architect exam questions. In order to meet the needs of all customers, the team of the experts in our company has done the research of the Integration-Architect study materials in the past years. As a result, they have gained an in-depth understanding of the fundamental elements that combine to produce world class Integration-Architect practice materials for all customers.
