Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q32-Q37):

NEW QUESTION # 32
Which productivity advantage does Anypoint Platform have to both implement and manage an API?

- A. Automatic API governance
- B. Automatic API specification generation
- C. Automatic API proxy generation
- D. Automatic API semantic versioning

Answer: C

Explanation:
Anypoint Platform, MuleSoft's unified platform for API design and integration, offers several productivity advantages for both implementing and managing APIs. Among these features, automatic API proxy generation is particularly beneficial. Here's a step-by-step explanation:
* API Implementation:
* Design Center: In the Design Center, users can create API specifications using RAML or OAS.
This environment provides tools to design and document APIs effectively.
* Exchange: After defining the API, it can be published to Anypoint Exchange where it can be shared and discovered by others within the organization.
* Automatic API Proxy Generation:
* When an API is published to Exchange, Anypoint Platform allows for the automatic creation of an API proxy. An API proxy acts as a facade for your backend API, providing a layer of abstraction and security.
* Advantages:
* Security: Protects backend services by exposing only necessary endpoints and handling authentication, authorization, and rate limiting.
* Traffic Management: Helps in managing traffic through throttling and caching.
* Monitoring: Facilitates monitoring and logging to track API usage and performance.
* This automation saves time and reduces the complexity of manual proxy setup, allowing developers to focus on core business logic.
* API Management:
* API Manager: Provides a dashboard to manage API policies, versions, and SLA tiers. Users can apply security policies, monitor traffic, and analyze API usage.
* Monitoring: Integrated with Anypoint Monitoring, users get insights into API performance and health, enabling proactive management.

NEW QUESTION # 33
A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.
Which type of communication management does a service mesh typically perform in this architecture?

- A. Between the application and external API implementations
- B. Between application services and the firewall
- C. Between the application and external API clients

- D. Between services within the application

Answer: D

Explanation:
A service mesh is typically used to manage communication between microservices within a distributed application. Here's a detailed explanation:
* Service Mesh:
* Definition: A service mesh is a dedicated infrastructure layer that manages service-to-service communication within a microservices architecture.
* Features: Provides features such as load balancing, service discovery, traffic management, and security (e.g., mutual TLS).
* Intra-Application Communication:
* Focus: It focuses on internal communication between microservices, ensuring reliability, security, and observability of inter-service communications.
* Management: Handles retries, circuit breaking, and service-to-service authentication transparently.
* API Gateway:
* Complementary Role: While a service mesh manages internal microservice communications, an API gateway manages external client requests and provides a single entry point for external API clients.

NEW QUESTION # 34
A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load Which scalability option is the controller implementing?

- A. Vertical
- B. Down
- C. Diagonal
- D. Horizontal

Answer: D

Explanation:
Kubernetes offers several scalability options to handle varying application loads. The scenario described involves adding another pod replica in response to increased load, which is a form of horizontal scaling. Here' s a detailed explanation:
* Horizontal Scaling:
* Definition: Horizontal scaling, also known as scaling out, involves adding more instances (pods) to distribute the load and increase capacity.
* Implementation in Kubernetes: Kubernetes uses controllers like the Horizontal Pod Autoscaler (HPA) to automatically adjust the number of pod replicas based on observed CPU utilization or other select metrics.
* Benefits:
* Load Distribution: By adding more pod replicas, the load is evenly distributed, reducing the risk of any single pod being overwhelmed.
* Fault Tolerance: Horizontal scaling enhances fault tolerance and availability, as multiple pod replicas can handle requests if one fails.
* Automatic Scaling:
* Kubernetes Controller: The HPA continuously monitors the application load and adjusts the number of pod replicas accordingly, ensuring optimal performance.

NEW QUESTION # 35
Which component of AnypointPlatform belongs to the platform control plane"?

- A. API Manager
- B. Anypoint Connectors
- C. Runtime Fabric

- D. Runtime Replica

Answer: A

Explanation:
In Anypoint Platform, the control plane is responsible for managing and controlling the various components and services that make up the platform. API Manager is part of the control plane, providing centralized management of APIs. Here's a detailed explanation:
* Control Plane:
* Definition: The control plane in Anypoint Platform is responsible for the management, monitoring, and control of APIs, applications, and other platform resources.
* Components: Includes tools for API management, analytics, security, and governance.
* API Manager:
* Purpose: Allows users to manage API policies, monitor API usage, and secure APIs. It provides a centralized interface for managing the entire lifecycle of APIs.
* Features:
* Policy Enforcement: Apply security policies, rate limiting, and other governance rules.
* Analytics and Monitoring: Track API performance, usage statistics, and detect anomalies.
* Access Control: Manage user access and permissions for APIs.

NEW QUESTION # 36
A high-volume eCommerce retailer receives thousands of orders per hour and requires notification of its order management warehouse, and billing systems for subsequent processing within 15 minutes of order submission through its website Which integration technology, when used for its typical and intended purpose, meets the retailer's requirements for this use case?

- A. EnterpriseData Warehouse (EDW)
- B. Extract Transform Load (ETL)
- C. Publish/Subscribe Messaging Bus (Pub/Sub)
- D. Managed File Transfer (MFT)

Answer: C

Explanation:
For a high-volume eCommerce retailer requiring real-time or near-real-time notifications to multiple systems, a Publish/Subscribe Messaging Bus is an ideal choice. Here's a detailed explanation:
* Publish/Subscribe Model:
* Definition: The Pub/Sub messaging model allows messages to be sent (published) by producers and received (subscribed to) by multiple consumers.
* Asynchronous Communication: It decouples the sender and receiver, enabling asynchronous communication.
* Use Case Fit:
* Real-Time Processing: Suitable for scenarios requiring real-time or near-real-time data processing and notification.
* Scalability: Handles high volumes of messages efficiently, making it suitable for environments with thousands of transactions per hour.
* Implementation:
* Message Broker: A message broker (e.g., Apache Kafka, RabbitMQ) can manage the distribution of messages to the order management, warehouse, and billing systems.
* Guaranteed Delivery: Ensures that messages are reliably delivered to all subscribed systems within the required time frame.
