UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q78-Q83):

NEW QUESTION # 78

What is a key activity carried out during the User Acceptance Testing (UAT) stage?

- A. Testing the automation in a business-like environment by end users
- B. Reviewing project SOW
- C. Conducting informal process shadowing
- D. Developing reusable components

Answer: A

Explanation:

During the User Acceptance Testing (UAT) stage, the automation is tested in a business-like environment by end users to confirm that it meets the agreed-upon requirements and performs as expected under real-world conditions.

This phase is critical because it validates the automation's functionality, accuracy, reliability, and usability.

End users - usually from the Client Team - execute test cases defined earlier, often based on the Process Definition Document (PDD) and UAT Plan.

If any bugs or discrepancies are identified, they are reported and fixed by the Automation Developer. Only after successful completion of UAT is the automation approved for deployment into the production environment. This stage ensures stakeholder confidence and minimizes risk before go-live.

NEW QUESTION # 79

Which of the following best describes the Automation Business Analyst's role during the Process Analysis stage?

- A. Analyzes the As-Is process and defines the To-Be process
- B. Defines coding best practices
- C. Handles infrastructure provisioning
- D. Approves solution architecture

Answer: A

Explanation:

During the Process Analysis stage, the Automation Business Analyst is responsible for analyzing the current (As-Is) process and defining the future (To-Be) process to be automated. This includes mapping out each step, understanding business rules, identifying inefficiencies, and collaborating with stakeholders to envision how automation will change the process.

The Business Analyst also works closely with the Solution Architect to prepare the Process Definition Document (PDD) and ensures that the process is well-documented for the developers to understand and automate.

This role is essential for bridging the gap between business users and technical implementers, ensuring that the solution reflects the true needs of the business while being technically feasible.

NEW QUESTION # 80

What document outlines the tests to be performed and logistics for end-user testing after development?

- A. Application Tracker
- B. Solution Design Document (SDD)
- C. Project Readiness Checklist
- D. User Acceptance Testing (UAT) Plan

Answer: D

Explanation:

The User Acceptance Testing (UAT) Plan is the document that details how end-user testing will occur once development is complete. It defines the test cases, success criteria, testing timelines, and responsible parties from both the Implementation and Client Teams.

This document is essential for organizing the UAT phase, ensuring that all involved stakeholders are aware of what will be tested, how issues will be logged, and who is responsible for resolving them. It also outlines the criteria that must be met for the automation to be considered acceptable and ready for production.

The UAT Plan supports a structured and transparent testing process, minimizing the risk of miscommunication and ensuring that the delivered solution meets business expectations. It helps validate that the automation aligns with the agreed-upon requirements, business rules, and user needs captured during the earlier stages of the project.

NEW QUESTION # 81

Which of the following roles is responsible for defining the automation architecture and advising the development team?

- A. Automation Developer
- B. Infrastructure Engineer
- C. Solution Architect
- D. Business Analyst

Answer: C

Explanation:

The Solution Architect plays a pivotal role in automation projects by defining the overall automation architecture, acting as the technical lead, and advising the development team on implementation approaches.

Their responsibility is to ensure that the solution design aligns with the automation goals, technical standards, and scalability requirements.

They collaborate closely with the business analyst to understand the process requirements and then map out a future-state process by selecting suitable tools, frameworks, and best practices. Solution architects also evaluate integration requirements, security considerations, infrastructure dependencies, and performance expectations.

Throughout the automation lifecycle - from solution design to development, UAT, and deployment - the solution architect remains involved to resolve technical issues, optimize the design, and validate the solution's robustness. Their involvement ensures technical consistency and quality across all stages of implementation.

NEW QUESTION # 82

Which document is completed and approved before defining UAT test scenarios and success criteria?

- A. Kickoff Meeting Notes
- B. Solution Design Document
- C. Project Readiness Checklist
- D. **Process Definition Document (PDD)**

Answer: D

Explanation:

The Process Definition Document (PDD) must be completed and approved before defining the User Acceptance Testing (UAT) test scenarios and success criteria. The PDD provides a detailed account of the As-Is process and forms the basis for understanding what the automation is expected to achieve.

Once the PDD is finalized, the Client Team uses it to:

- * Define what a successful automation outcome looks like
- * Prepare test cases that reflect typical and exception scenarios
- * Set benchmarks and expectations for functionality and performance

This ensures that UAT is structured, objective, and aligned with real-world business operations. Bypassing this sequence could lead to poorly defined tests or unvalidated business needs, increasing the risk of project failure.
