TOP New Network-Security-Essentials Exam Bootcamp 100% Pass | High

Pass-Rate WatchGuard Exam Network Security Essentials for Locally-Managed Fireboxes Objectives Pdf Pass for sure

We have a large number of regular customers exceedingly trust our Network-Security-Essentials training materials for their precise content about the exam. You may previously have thought preparing for the Network-Security-Essentials preparation materials will be full of agony, actually, you can abandon the time-consuming thought from now on. Our Network-Security-Essentials Exam Questions are famous for its high-efficiency and high pass rate as 98% to 100%. Buy our Network-Security-Essentials study guide, and you will pass the exam easily.

WatchGuard Network Security Essentials for Locally-Managed Fireboxes Sample Questions (Q30-Q35):

NEW QUESTION # 30

As you troubleshoot a Branch Office VPN tunnel, you see the log message below. Which settings can you modify in the BOVPN virtual interface configuration to resolve this issue? (Select one.)

- A. BOVPN-Allow policies
- B. Phase 1 Settings
- C. Phase 2 Settings
- D. Gateway Settings
- E. VPN Routes

Answer: C

Explanation:

When troubleshooting a Branch Office VPN (BOVPN) tunnel, issues in the Phase 2 settings can commonly cause connectivity problems. Adjusting settings such as the encryption and integrity algorithms, or setting correct lifetimes in Phase 2, may resolve compatibility or timeout issues with third-party VPN endpoints. This configuration ensures the two VPN endpoints can securely exchange data in alignment with each other's capabilities and settings.

NEW QUESTION # 31

Match each type of NAT with the correct descriptor

Answer:

Explanation:

Explanation:

Here are the correct answers for matching each NAT type with its descriptor:

* Changes incoming packets sent to a public IP address to different internal IP addresses based on the destination port
answer: Static NAT
Explanation: Static NAT maps a public IP address to multiple internal IP addresses based on the port, allowing specific services or applications to be routed to various internal destinations.

* Allows a user on the trusted or optional network to connect to a public server that is on the same physical Firebox interface by its public IP address or domain name
answer: NAT loopback
Explanation: NAT loopback (or NAT reflection) allows internal users to access a public IP address or domain name that resolves to the same local network, making it appear as if they are connecting from outside the network.

* Conserves IP addresses and hides the internal topology of your network
answer: Dynamic NAT
Explanation: Dynamic NAT (or PAT - Port Address Translation) conserves public IP addresses by allowing multiple internal devices to share a single public IP address. This setup is commonly used for outbound internet connections from a private network.

* Changes all incoming and outgoing packets sent from one range of addresses to a different range of addresses
answer: 1-to-1 NAT
Explanation: 1-to-1 NAT maps each internal IP address to a unique public IP address, providing a one-to-one relationship. This type of NAT is often used for networks that require external access to specific internal resources.

NEW QUESTION # 32

Users cannot download a PDF file from your intranet. You know the file is safe to download. When you review the log messages, you see that IntelligentAV identified the file as malicious. The only way to resolve this is to change the file extension.

- A. False

- B. True

Answer: A

Explanation:

When IntelligentAV identifies a file as malicious, users have options other than changing the file extension to resolve the issue. IntelligentAV relies on AI-driven detection, and if the PDF file is known to be safe, an administrator can manually adjust the IntelligentAV settings or add an exception for the specific file.

Changing the file extension alone does not address the root of the detection and is not a reliable solution to bypass IntelligentAV checks.

NEW QUESTION # 33

To accurately detect applications over an HTTPS connection with Application Control, you must enable content inspection in the HTTPS proxy.

- A. False
- **B. True**

Answer: B

Explanation:

For Application Control to accurately detect and manage applications over HTTPS connections, content inspection must be enabled in the HTTPS proxy. This is because HTTPS encrypts application traffic, making it unreadable without decryption. By enabling content inspection, the HTTPS proxy can inspect and classify the application traffic within HTTPS sessions, allowing Application Control to function effectively on secure connections.

NEW QUESTION # 34

You bought a new Firebox and want to use the configuration from an existing Firebox you already configured. The best way to migrate the configuration is to restore a backup image from the existing Firebox to the new Firebox, then add the new feature key.

- A. False
- **B. True**

Answer: B

Explanation:

When migrating configurations from one Firebox to another, restoring a backup image from the existing Firebox to the new one is a valid and efficient method. This approach will transfer all configuration settings, policies, and security settings to the new Firebox. After restoring the backup, you need to add the new feature key specific to the new Firebox, as feature keys are unique to each device. This method preserves the existing configurations while adapting the setup for the new hardware.

NEW QUESTION # 35

.....

A good learning platform should not only have abundant learning resources, but the most intrinsic things are very important, and the most intuitive things to users are also indispensable. Imagine, if you're using a Network-Security-Essentials practice materials, always appear this or that grammar, spelling errors, such as this will not only greatly affect your mood, but also restricted your learning efficiency. Therefore, good typesetting is essential for a product, especially education products, and the Network-Security-Essentials test material can avoid these risks very well.
