## Free PDF Quiz ISTQB - Authoritative ISTQB-CTFL - ISTQB Certified Tester Foundation Level (CTFL v4.0) Training Kit

If you want to get ISTQB certification, you can save a lot of time and effort with our ISTQB-CTFL study materials. We know that you must have a lot of other things to do, and our products will relieve your concerns in some ways. First of all, ISTQB-CTFL exam materials will combine your fragmented time for greater effectiveness, and secondly, you can use the shortest time to pass the exam to get your desired certification. Our ISTQB-CTFL Study Materials allow you to improve your competitiveness. With the help of our ISTQB-CTFL study guide, you will be the best star better than others

## ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q65-Q70):

### NEW QUESTION # 65

Which of the following is an INCORRECT statement about the benefit of traceability between the test basis and test work products?

- A. Traceability may allow testing to be auditable
- B. Traceability may help evaluate the extent of test coverage
- C. Traceability may make it harder to understand the impact of changes
- D. Traceability may be required by IT governance rules

**Answer: C**

#### Explanation:

The statement "Traceability may make it harder to understand the impact of changes" is incorrect. Traceability in testing actually facilitates understanding the impact of changes by linking test cases to requirements. This linkage helps ensure that any changes in the requirements are adequately reflected and verified in the test cases, thus supporting effective management of changes and maintaining the integrity of the system or product being developed (ISTQB not-for-profit association) (ISTQB Main Web). #### NEW QUESTION # 66

You are testing a system that is used in motor vehicles to warn the driver of an obstacle when re-versing.

Output is provided by a series of LED lights (green, yellow, and red), each illuminated based on clearly defined conditions.

The following summary describes the functionality:

\*Object within 10 metres, green LED lit.

\*Object within 5 metres, yellow LED lit.

\*Object within 1 metre, red LED lit.

\*Setting sensitivity mode to "ON" will result in only the red LED being lit when the object is within 1 metre.

The following decision table describes the rules associated with the functioning of this proximity warning system:

Which intended functionality is tested by Rule 5 in the decision table?

- A. Object is within 5 metres of the vehicle and the sensitivity mode is switched "off", resulting in no LED being lit.
- B. Object is within 5 metres of the vehicle and the sensitivity mode is switched "off", resulting in the yellow LED being lit.
- **C. Object is within 5 metres of the vehicle and the sensitivity mode is switched "on", resulting in no LED being lit.**
- D. Object is within 5 metres of the vehicle and the sensitivity mode is switched "on", resulting in the yellow LED being lit.

#### Answer: C

#### Explanation:

Rule 5 in the decision table indicates that when the object is within 5 metres of the vehicle and the sensitivity mode is switched "on", no LED is lit. This matches the conditions and actions described in the decision table provided, ensuring that only the red LED is lit when the sensitivity mode is on and the object is within 1 metre, otherwise no LED is lit.

#### NEW QUESTION # 67

Which of the following statements best describes how configuration management supports testing?

- A. Configuration management helps reduce testing effort by identifying a manageable number of test environment configurations in which to test the software, out of all possible configurations of the environment in which the software will be released
- B. Configuration management is an approach to interoperability testing where tests are executed in the cloud, as the cloud can provide cost-effective access to multiple configurations of the test environments
- C. Configuration management is an administrative discipline that includes change control, which is the process of controlling the changes to identified items referred to as Configuration Items'
- **D. Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation**

#### Answer: D

#### Explanation:

This answer is correct because configuration management is a process of establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design, and operational information throughout its life.

Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation. This supports testing by providing traceability, consistency, and control over the test artifacts and the software under test. #### NEW QUESTION # 68

Which of the following BEST defines risk level?

- A. Risk level is determined by the likelihood of an event happening and the impact or harm from that event
- B. Risk level is calculated by adding the probabilities of all planned risks to a project
- C. Risk level is determined by calculating the absolute value of the sum of all potential issues that may occur on the project
- D. Risk level is calculated by dividing the sum of all known risks by the sum of all unknown risks

**Answer: A**

Explanation:

Risk level is determined by the combination of two factors: the likelihood of an event occurring and the impact or harm that could result from that event. This approach allows risks to be prioritized based on their potential effect on the project or system. The likelihood represents the probability of the risk event occurring, while the impact represents the severity of the consequences if the event does happen. This concept is fundamental in risk-based testing and helps guide decision-making during the testing process.

#### **NEW QUESTION # 69**

Which ONE of the following options BEST describes black-box test techniques?

- A. Black-box testing techniques are based on analyzing the test object's specified and implied behavior without knowledge of its internal data structure.
- B. Black-box testing techniques involve analyzing the specified behavior of the test object without knowledge of its internal structure.
- C. In black-box testing techniques, test cases are created based on the software's implementation.
- D. Black-box testing techniques are based on experience with the test object without knowing the internal structure.

**Answer: B**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Black-box testing techniques focus on testing the functionality of the software without knowledge of its internal workings (D). They derive test cases from specifications, requirements, or expected behavior.

Option A describes exploratory testing, B contradicts the definition by focusing on implementation, and C incorrectly includes "implied behavior," which is not a core characteristic of black-box testing.
