Cloudera CDP Data Engineer - Certification Exam Sample Questions (Q301-Q306):

NEW QUESTION # 301

Which security feature offered by the Cloudera Data Engineering service allows granular access control to data pipelines and resources?

- A. Apache Ranger
- B. Role-based access control (RBAC).
- C. Cloudera Manager Security
- D. Kerberos authentication

Answer: A

Explanation:

Apache Ranger, integrated with the Cloudera Data Engineering service, provides fine-grained authorization and access control capabilities for data pipelines and resources. It allows admins to define who has access to specific data assets and operations within the platform.

NEW QUESTION # 302

You encounter an error during a data quality check within your Airflow DAG. How can you access detailed information about the error to aid in troubleshooting?

- A. The Airflow web UI task details page might display error messages related to the failed check.
- B. The Airflow logs (scheduler, worker) might contain relevant error messages from the failing task.
- C. You can directly inspect the custom Python script used for the check to identify potential issues.
- **D. All of the above**

Answer: D

Explanation:

While option D might be desirable if both approaches are applicable, storing sensitive data in code is insecure (option D)

NEW QUESTION # 303

Which feature in Apache Airflow allows you to retry a data quality check task if it fails initially due to transient issues?

- A. catchup
- **B. retries parameter in the task definition**
- C. Branching
- D. SLAs

Answer: B

Explanation:

The retries parameter in an Airflow task's definition specifies how many times Airflow should retry the task in case of failure. This is particularly useful for handling transient issues that might cause a data quality check to fail, such as temporary network outages or database lock issues.

NEW QUESTION # 304

In Apache Airflow, how can you ensure that a data quality check task is only executed if a previous data ingestion task succeeded and the ingested data volume exceeds a certain threshold?

- A. Configure the trigger_rule parameter to all_success and use a PythonOperator to verify the data volume.
- **B. Utilize the ShortCircuitOperator with a custom Python function to check both conditions.**
- C. Use a BranchPythonOperator with a condition that checks the success of the ingestion task and the data volume.
- D. Implement a PythonOperator with a pre_execute hook for the condition check.

Answer: B

Explanation:

The ShortCircuitOperator is designed for situations where subsequent tasks should only run based on the outcome of a condition. By using this operator with a custom Python function that verifies both the success of the previous task and whether the data volume exceeds a specific threshold, you can effectively control the execution flow of your data quality checks.

NEW QUESTION # 305

What does setting the Spark configuration parameter spark.sql.shuffle.partitions impact?

- A. The serialization format of data
- B. The memory allocation for executor instances
- **C. The default level of parallelism for joins and aggregations**
- D. The compression codec used for shuffle files

Answer: C

Explanation:

The spark.sql.shuffle.partitions configuration parameter sets the number of partitions to use when shuffling data for joins or aggregations, which directly impacts the level of parallelism and the performance of these operations. A high number of partitions can lead to smaller tasks, potentially improving parallelism but at the cost of increased scheduling overhead. Conversely, too few partitions can lead to fewer, larger tasks, possibly causing out-of-memory errors or underutilizing the cluster.
