## Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q35-Q40):

### NEW QUESTION # 35

When is a volume considered "Public"?

- A. When guest access is enabled
- B. When a volume is owned by system admin
- C. When the volume does not have any ownership associated with it

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Portworx, a volume is considered "Public" when guest access is enabled. Guest access allows users and applications without explicit Portworx authentication credentials to access the volume. This setting is typically used in less restrictive environments where access control is relaxed, but it reduces security by exposing data to potentially unauthorized entities. Public volumes can be accessed by any entity with network connectivity and basic permissions, which is why enabling guest access is carefully controlled in secure deployments. Portworx documentation on security models and access controls stresses that public volumes should be used sparingly and monitored closely due to the elevated risk of data exposure and compliance violations **【Pure Storage Portworx Security Guide source】** .

#### NEW QUESTION # 36

What command should be used to add a new drive to an existing storage cluster?

- A. `pxctl sv nw -a`
- B. `pxctl service pool update -resize new-disk 150`
- C. `pxctl service drive add -drive /dev/dm-1 -operation start`

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Adding a new drive to an existing Portworx storage cluster involves bringing the physical device online for Portworx management. The correct command for this is `pxctl service drive add -drive /dev/dm-1 -operation start`. This command instructs Portworx to recognize and incorporate the new drive specified by the device path (e.g., `/dev/dm-1`) into its storage pool. After this operation, Portworx can use the drive for provisioning volumes or expanding capacity. The `-operation start` flag signals Portworx to initialize and prepare the drive for use. This method is part of Portworx's dynamic storage management capabilities, allowing flexible scaling of storage resources without downtime. Official CLI documentation outlines this command as the supported approach to adding drives to running clusters safely and efficiently **【Pure Storage Portworx CLI Guide source】** .

#### NEW QUESTION # 37

What solution should a Portworx administrator use to store snapshots of a critical application volume in an Object Store?

- A. Local Snapshot
- B. Backups
- C. Cloud Snapshot

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Cloud Snapshots are designed to store snapshots of critical application volumes directly into an external Object Store such as Amazon S3 or other S3-compatible storage. This solution provides offsite durability, disaster recovery capability, and long-term retention beyond the cluster's local storage capacity. Cloud Snapshots allow administrators to create consistent, incremental snapshots that are efficiently uploaded to cloud storage, enabling protection against data loss scenarios such as cluster failure or site outages. This contrasts with Local Snapshots, which remain on the cluster's local storage, and Backups, which may refer to full data copies. The Portworx documentation explains Cloud Snapshots as the recommended approach for storing critical volume snapshots securely and durably offsite, supporting business continuity strategies **【Pure Storage Portworx Cloud Snapshot Guide source】** .

#### NEW QUESTION # 38

Which command could be used to install Portworx on Kubernetes using the PX-Operator?

- A. `kubectl apply -f "https://install.portworx.com/<portworx_version>?operator=true&mc=false&kbver=1.25.0&ns=portworx&b=true&kd=type%3Dgp3%2Csize%3D150&s=%2F%2F22type%3Dgp3%2Csize%3D150&c=px-cluster-05847fl-b6be-4608-800c-2ac5fb8069e0&stork=true&csi=true&mon=true&tel=false&st=k8s&promop=true"`
- B. `kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"`
- C. `curl -O px-ag-install.sh -L "https://install.portworx.com/$PXVER/air-gapped?kbver=$KBVER"`

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The officially recommended method to install Portworx with Kubernetes Operator support is using the PX-Operator manifest. This is done by applying the manifest URL with the `comp=pxoperator` parameter. The command: `kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"` deploys the Portworx Operator, which manages Portworx lifecycle operations such as installation, upgrades, and configuration changes within the Kubernetes cluster. Specifying the Kubernetes version (`kbver`) and namespace (`ns`) ensures compatibility and proper scoping. This operator-centric installation enables more efficient management and automation compared to standalone scripts or manual installations. Portworx official operator installation documentation confirms this approach as the best practice for production deployments, streamlining Portworx management in Kubernetes environments **【Pure Storage Portworx Operator Installation Guide source】** .

#### NEW QUESTION # 39

How do you label a Kubernetes node to provide rack information to Portworx?

- A. `kubectl annotate nodes px/rack=`

- B. `kubectl taint nodes px/rack=`
- C. `kubectl label nodes px/rack=`

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Labeling Kubernetes nodes with rack information is achieved using the `kubectl label nodes` command. The syntax would be something like `kubectl label nodes <node-name> px/rack=<rack-identifier>`. This label allows Portworx to understand the physical or logical topology of nodes, enabling placement strategies that optimize data locality, fault tolerance, and availability based on rack awareness. Taints and annotations serve different purposes; taints affect pod scheduling by repelling pods, while annotations provide metadata without influencing scheduling. Portworx uses node labels extensively for topology-aware volume placement and disaster recovery planning. Official Portworx documentation recommends labeling nodes with topology identifiers like rack or zone to enable advanced placement strategies and maintain application resiliency in distributed environments **【 Pure Storage Portworx Placement Guide source 】** .
