## 最新的 AWS Certified Developer AWS-Developer 免費考試真題 (Q136-Q141):

### 問題 #136

A user is having access to objects of an S3 bucket which is not owned by him. If he is trying to set the objects of that bucket public, which of the below mentioned options may be a right fit for this action?

- A. Make the bucket public with full access
- B. Define the policy for the bucket
- C. Provide ACL on the object
- D. Create an IAM user with permission

答案: C

#### 解題說明:

An S3 object ACL is the only way to manage access to objects which are not owned by the bucket owner.

An AWS account that owns the bucket can grant another AWS account permission to upload objects. The bucket owner does not own these objects. The AWS account that created the object must grant permissions using object ACLs.

### 問題 #137

Which of the below mentioned commands allows the user to share the AMI with his peers using the AWS EC2 CLI?

- A. ec2-share-image-public
- B. ec2-share-image
- C. ec2-modify-image-attribute
- D. ec2-share-image-account

答案: C

#### 解題說明:

A user can share an AMI with another user / peer using the command:

ec2-modify-image-attribute <AMI-ID> -l -a <AWS Account ID>

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/sharingamis-explicit.html>

### 問題 #138

An application contains two components one component to handle HI IP requests, and another component to handle background processing tasks. Each component must scale independently. The developer wants to deploy this application using AWS Elastic Beanstalk.

How should this application be deployed, based on these requirements?

- A. Deploy the application in a single Elastic Beanstalk environment
- B. Use multiple Elastic Beanstalk environments for the background task component but one environment for the HTTP component
- C. Deploy each component in a separate Elastic Beanstalk environment
- D. Use multiple Elastic Beanstalk environments for the HTTP component but one environment for the background task component

答案: A

### 問題 #139

In a move toward using microservices, a company's Management team has asked all Development teams to build their services so that API requests depend only on that service's data store. One team is building a Payments service which has its own database; the service needs data that originates in the Accounts database.

Both are using Amazon DynamoDB.

What approach will result in the simplest, decoupled, and reliable method to get near-real time updates from the Accounts database?

- A. Use Amazon Glue to perform frequent ETL updates from the Accounts database to the Payments database.
- B. Use Amazon Kinesis Data Firehouse to deliver all changes from the Accounts database to the Payments database.
- C. Use Amazon ElastiCache in Payments, with the cache updated by triggers in the Accounts database.
- **D. Use Amazon DynamoDB Streams to deliver all changes from the Accounts database to the Payments database.**

答案： D

#### 問題 #140

An application running on an Amazon Linux EC2 instance needs to manage the AWS infrastructure.

How can the EC2 instance be configured to make AWS API calls securely?

- A. Run the aws configure AWS CLI command and specify the access key id and secret access key.
- B. Sign the AWS CLI command using the signature version 4 process.
- **C. Specify a role for the EC2 instance with the necessary privileges.**
- D. Pass the access key id and secret access key as parameters for each AWS CLI command.

答案： C
