問題 #48

An administrator has been tasked with analyzing the impact of deploying a new application. The current infrastructure is using an external storage array.

What vRealize Operations What-If Analysis should the administrator perform to get this information?

- A. Infrastructure Planning: Hyperconverged
- **B. Workload Planning: Traditional**
- C. Infrastructure Planning: Traditional
- D. Workload Planning: Hyperconverged

答案：B

解題說明：

To analyze the impact of deploying a new application in an environment using an external storage array, the administrator should perform a Workload Planning: Traditional analysis in vRealize Operations. This type of analysis focuses on traditional infrastructure, which includes external storage arrays and other non- hyperconverged components. It allows for evaluating how the new application might affect resources such as CPU, memory, and storage, while considering the traditional setup of the infrastructure.

問題 #49

Which capability of vRealize Suite Lifecycle Manager can help administrators with the use case of automating day 2 operations in a private cloud environment?

- A. Proactive findings and recommendations delivered on-demand.
- **B. Management of configurations, certificates, licenses, passwords, and users.**
- C. Proactive monitoring and automated remediation of Workspace ONE Access database consistency problems.
- D. Centralized log analysis for all vRealize components deployed on-premises.

答案： B

解題說明：

vRealize Suite Lifecycle Manager (vRSLCM) offers a range of features to manage the lifecycle of vRealize Suite components. For automating day 2 operations in a private cloud environment, the capability of managing configurations, certificates, licenses, passwords, and users is essential. This allows administrators to streamline the ongoing management and maintenance of the cloud environment, which includes tasks like updating licenses, managing user access, and configuring system settings, thus automating several operational aspects of the environment.

問題 #50

Forty days ago, an administrator provisioned a Virtual Machine (vm-01) in preparation for a new project. The project has now been delayed due to budgetary constraints. As part of the monthly service management checks, a second administrator executes the reclaim action on all idle virtual machines and vm-01 is listed.

The second administrator accidentally reclaims all idle virtual machines including vm-01.

What action can the administrator complete to prevent this scenario from happening again?

- A. Disable Capacity reclamation on the policy applied to new virtual machines.
- B. Create a dynamic group with membership based on vSphere tags so that all new virtual machines are included and then exclude the entire group from reclaim analysis.
- C. Create a new policy that disables the capacity reclamation on the policy and apply the policy to the parent object hosting new virtual machines.
- **D. Increase the default value of the Exclude VM provisioned in the last x days setting.**

答案： D

解題說明：

To prevent virtual machines like vm-01 from being reclaimed too early, the administrator can increase the default value of the Exclude VM provisioned in the last x days setting. This ensures that newly provisioned VMs, like vm-01, will be excluded from the reclamation process for a longer period (e.g., 30, 60, or more days), preventing accidental reclamation of VMs that are still in use or under consideration for future projects.

This action directly addresses the issue of accidentally reclaiming recently provisioned virtual machines.

問題 #51

Which vRealize Log Insight deployment architecture is valid?

- A. A three node cluster forwarding all messages to a three node cluster in another datacenter
- B. A four node cluster deployed with two nodes in each of two datacenters
- C. A three node cluster with a large central node and two smaller remote nodes
- **D. A six node cluster deployed with three nodes in each of two datacenters**

答案： D

解題說明：

vRealize Log Insight supports the deployment of multi-node clusters across multiple data centers for high availability and scalability. The architecture with three nodes in each of two separate data centers ensures fault tolerance and load balancing. The six-node cluster can operate across the two datacenters and provides a resilient and distributed logging solution.

問題 #52

A vRealize Log Insight (vRLI) administrator wants to search archived logs for certain events. What are the required steps to provide the administrator the ability to search the log messages?

- A. SSH into the NFS server, mount the archiving partition, then import the archive using CLI to vRLI appliance.
- B. SSH into the vRLI appliance, install vRLI tools, then import the archive using CLI from NFS share to the vRLI appliance.
- C. SSH into the NFS server, install vRLI tools, then import the archive using CLI from NFS share to the vRLI appliance.
- **D. SSH into the vRLI appliance, mount the archiving NFS share then import the archive using CLI.**

答案：D

解題說明：

To allow the administrator to search archived logs in vRealize Log Insight (vRLI), the logs stored in an NFS share must be imported into the vRLI appliance. The correct steps involve SSHing into the vRLI appliance, mounting the NFS share where the archived logs are stored, and then using the CLI to import the archived logs into the vRLI appliance for searching. This is the standard method for handling archived log files in vRLI.
