Axis Network Video Exam Sample Questions (Q241-Q246):

NEW QUESTION # 241

Using AXIS Camera Management, which of the following can be performed? (Choose two)

- A. Apply templates to devices
- B. Configure crossline detection
- C. Upgrade firmware

- D. Set motion detection windows
- E. View recorded video

Answer: A,C

Explanation:

AXIS Camera Management (ACM) is a powerful tool for managing multiple Axis network devices efficiently.

With ACM, administrators can apply templates to devices, which streamlines the configuration process by allowing predefined settings to be distributed across multiple devices. Additionally, ACM facilitates the upgrading of firmware on Axis devices, ensuring that all cameras and encoders are up-to-date with the latest features and security patches. Axis Network Video documentation highlights these capabilities as key features of ACM, enhancing the overall management and maintenance of surveillance systems.

NEW QUESTION # 242

Where is the best place to mount a camera with a fixed iris?

- A. Inside, in a room with very strong light sources
- B. Outside, on a pole
- C. Inside, in a room with large windows
- **D. Outside, in a shadowed position**

Answer: D

Explanation:

A camera with a fixed iris is best mounted outside in a shadowed position. Fixed iris lenses do not adjust to changes in light levels, making them less suitable for environments with varying lighting conditions. By placing the camera in a shadowed position, you minimize the impact of direct sunlight and glare, which can cause overexposure and poor image quality. Therefore, the correct answer is C. For more detailed information, refer to Axis Communications' documentation on camera installation and fixed iris lenses.

NEW QUESTION # 243

An analog system that should be upgraded to IP using encoders must have the end of the analog signal terminated. How many Ohm (Ω) should that be?

- **A. 0**
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

When upgrading an analog system to IP using encoders, the end of the analog signal must be terminated with a 75 resistor. This standard impedance ensures proper signal transmission and prevents signal reflections that can degrade the video quality. Terminating the signal correctly is crucial for maintaining the integrity of the video feed in an analog to IP conversion. For more information, refer to Axis Communications' technical documentation on analog to IP conversion and signal termination.

NEW QUESTION # 244

What type of lens is this?

- A. A CS-mount lens
- B. A C-mount lens
- C. A block lens
- **D. An M12 lens**

Answer: D

Explanation:

"M12 lenses are easily recognized by their small size and the thread on the lens barrel. The M12 refers to the metric thread diameter

(12 mm), which is much smaller than C/CS-mount lenses. These are often used in compact and modular camera models."

- Axis Communications Academy, Network Video Fundamentals, 2022

"M12-mount lenses are also called 'board lenses' and are screwed directly into the camera's sensor module."

NEW QUESTION # 245

The camera sensors in Axis' multidirectional cameras can be

- A. moved only as one unit.
- B. added or removed.
- C. individually adjusted.
- D. stitched for a seamless image.

Answer: C

Explanation:

The camera sensors in Axis' multidirectional cameras can be individually adjusted. This flexibility allows each sensor to be positioned independently, enabling optimal coverage of the desired areas. Such adjustability ensures that a single camera unit can cover multiple directions or areas, enhancing the efficiency and effectiveness of the surveillance setup. Axis' multidirectional camera specifications and manuals provide detailed information on this feature.
