ISTQB CT-UT Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Basic Concepts: This section measures the skills of Usability Analysts and covers fundamental definitions and ideas related to usability, user experience, and accessibility. It explains what usability means in terms of effectiveness, efficiency, and satisfaction within software products. User experience concepts related to emotions, perceptions, and responses before, during, and after use are included. It also addresses accessibility, focusing on usage by people with diverse abilities.
Topic 2	<ul style="list-style-type: none">Selecting Appropriate Methods: This domain helps Test Managers make decisions on which usability evaluation methods to apply depending on project context, resources, and maturity. It discusses criteria for selecting usability, user experience, and accessibility evaluation methods suited to different stages of development and organizational needs, including agile development scenarios.

Topic 3	<ul style="list-style-type: none"> • Usability Testing: This section measures the practical knowledge of Usability Testers in planning, conducting, analyzing, and reporting formal usability test sessions with users. It outlines test preparation activities including writing test plans, test scripts, and tasks, as well as considerations for test locations and pilot sessions. It explains how to moderate sessions, analyze findings, classify problems by severity, and communicate results effectively to stakeholders.
Topic 4	<ul style="list-style-type: none"> • Risks in Usability, User Experience and Accessibility: This domain assesses the ability of Risk Analysts to identify and analyze common risks that can affect usability, user experience, and accessibility. It differentiates between product risks—such as users being unable to use a product effectively—and project risks, including lack of expertise or insufficient usability evaluation processes. Understanding these risks helps in planning effective usability testing and evaluation.
Topic 5	<ul style="list-style-type: none"> • Usability and Accessibility Standards: This part addresses the knowledge required by Compliance Officers regarding standards and guidelines that govern usability and accessibility. It introduces ISO standards like ISO 9241-110 and ISO 9241-171, manufacturer guidelines from major platforms, and web accessibility guidelines such as WCAG. It also touches on legislation relevant to accessibility requirements, such as the UK Equality Act and the Americans with Disabilities Act.

ISTQB Certified Tester Usability Tester Sample Questions (Q39-Q44):

NEW QUESTION # 39

Which of the following is the correct distinction between formative and summative usability evaluation?

- A. Summative evaluations assess the outcome, formative evaluations focus on improvement
- B. Summative evaluations focus on improvement, formative evaluations assess the outcome
- C. Summative evaluations mostly rely on user tests, formative evaluations require experts
- D. Summative evaluations mostly rely on experts, formative evaluations require users

Answer: A

Explanation:

Formative usability evaluation is conducted during the development process to identify usability problems and improve the product iteratively. It is diagnostic and improvement-focused. Summative evaluation, on the other hand, is done after development to assess the final product's usability, measuring how well it meets defined usability goals. Therefore, the correct distinction is that formative evaluation focuses on improvement, and summative evaluation assesses the outcome. This distinction aligns with widely accepted models such as those defined by ISO 9241-210 and usability.gov.

NEW QUESTION # 40

Which of the following statements about usability testing is true?

- A. The preparation of a usability test is optional
- B. A usability test consists of one usability test session
- C. The conditions under which a usability test is done are irrelevant
- D. Before the usability test sessions, a pilot usability test session can be conducted

Answer: D

Explanation:

A pilot usability test session is a critical step prior to conducting the actual usability test. Its purpose is to ensure that the test setup, task design, and moderator instructions are clear and function as expected.

According to ISO 9241-210 and the Nielsen Norman Group's best practices, pilot testing helps detect unforeseen issues and fine-tune the process. Options A and B are incorrect because testing conditions must reflect realistic scenarios, and thorough preparation is essential to gather meaningful usability data. Option D is also incorrect; a usability test typically consists of multiple sessions with

different users to gather sufficient data for analysis. The pilot session ensures everything works smoothly before involving real participants.

NEW QUESTION # 41

You're defining usability test tasks for a web shop for mobile phones and smartphones. Finding out whether users are able to place an order easily has been identified as the main goal of the usability test.

Which of the following is a reasonable task definition to include in the test?

- A. Which mobile operating system do you prefer?
- B. Put the first phone you find in your shopping cart!
- C. Your phone broke and you're looking for a new smartphone. Your budget is 200\$ and it should have an infrared sensor as you like to operate your home entertainment system with it. Find a suited smartphone and order it!
- D. Enter the item number "1469483" in the search box and click "OK". Put the first item in the cart by clicking "add to bag". Then, click on "checkout" in order to start the order process. After that, fill in the form and click on "submit".

Answer: C

Explanation:

Option B represents a realistic, goal-oriented scenario that reflects how an actual user would interact with the website. It incorporates context, user intent, constraints, and desired outcome—all characteristics of well-designed usability tasks. Option A is vague and lacks real-world motivation. Option C is too prescriptive and limits insight into user behavior, while D is a survey question, not a usability task. According to Nielsen Norman Group and ISO 25062, the best usability tasks are scenario-based, realistic, and outcome-driven—making B the correct answer.

NEW QUESTION # 42

Your project manager asked you for your advice. A recent project failed because the users were not satisfied with the final product, although your project manager claimed that she followed the human-centered design process. She interviewed users at the start of the project, created a first prototype and evaluated that prototype.

Which part of the human-centered design process did she miss?

- A. The "design"-part
- B. The "analyze"-part
- C. The "evaluate"-part
- D. The "iterate"-part

Answer: D

Explanation:

The human-centered design process emphasizes iterative development—testing and refining designs through multiple cycles. In the scenario, the project manager interviewed users and evaluated a prototype but did not iterate based on feedback. Skipping iteration likely resulted in unmet user needs. Human-centered design, per ISO 9241-210, includes: understanding context of use, specifying requirements, producing design solutions, and evaluating—repeated iteratively. Hence, option D ("iterate") is correct.

#####

NEW QUESTION # 43

What location is NOT suitable for conducting a usability test?

- A. A room where no action of the user can be seen or recorded by any means.
- B. A public place, such as a cafe.
- C. Two office rooms that are connected by a video link.
- D. A room at the place where the test participant lives or works.

Answer: A

Explanation:

The primary goal of usability testing is to observe and record user behavior while interacting with the system.

A location where user actions cannot be seen or recorded (option A) completely undermines the test's purpose and is therefore not suitable.

While options B, C, and D are not ideal in all cases, they can still be valid settings depending on the context.

Testing in a user's natural environment (B) increases ecological validity. Remote testing via video link (C) is widely accepted. Testing in a public setting (D) can be useful for mobile apps or services intended for real-world use.
