## Palo Alto Networks NetSec-Analyst Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Object Configuration Creation and Application: This section of the exam measures the skills of Network Security Analysts and covers the creation, configuration, and application of objects used across security environments. It focuses on building and applying various security profiles, decryption profiles, custom objects, external dynamic lists, and log forwarding profiles. Candidates are expected to understand how data security, IoT security, DoS protection, and SD-WAN profiles integrate into firewall operations. The objective of this domain is to ensure analysts can configure the foundational elements required to protect and optimize network security using Strata Cloud Manager.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>• <b>Policy Creation and Application:</b> This section of the exam measures the abilities of Firewall Administrators and focuses on creating and applying different types of policies essential to secure and manage traffic. The domain includes security policies incorporating App-ID, User-ID, and Content-ID, as well as NAT, decryption, application override, and policy-based forwarding policies. It also covers SD-WAN routing and SLA policies that influence how traffic flows across distributed environments. The section ensures professionals can design and implement policy structures that support secure, efficient network operations.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• <b>Troubleshooting:</b> This section of the exam measures the skills of Technical Support Analysts and covers the identification and resolution of configuration and operational issues. It includes troubleshooting misconfigurations, runtime errors, commit and push issues, device health concerns, and resource usage problems. This domain ensures candidates can analyze failures across management systems and on-device functions, enabling them to maintain a stable and reliable security infrastructure.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• <b>Management and Operations:</b> This section of the exam measures the skills of Security Operations Professionals and covers the use of centralized management tools to maintain and monitor firewall environments. It focuses on Strata Cloud Manager, folders, snippets, automations, variables, and logging services. Candidates are also tested on using Command Center, Activity Insights, Policy Optimizer, Log Viewer, and incident-handling tools to analyze security data and improve the organization overall security posture. The goal is to validate competence in managing day-to-day firewall operations and responding to alerts effectively.</li> </ul>

### NEW QUESTION # 72

What are two differences between an implicit dependency and an explicit dependency in App-ID? (Choose two.)

- A. An explicit dependency does not require the dependent application to be added in the security policy
- B. An implicit dependency does not require the dependent application to be added in the security policy
- C. An explicit dependency requires the dependent application to be added in the security policy
- D. An implicit dependency requires the dependent application to be added in the security policy

**Answer: B,C**

#### NEW QUESTION # 73

Which two features implement one-to-one translation of a source IP address while allowing the source port to change? (Choose two.)

- A. Dynamic IP and Port (DIPP)
- B. Static IP
- C. Dynamic IP
- D. Dynamic IP / Port Fallback

**Answer: A,B**

Explanation:

Static IP and Dynamic IP and Port (DIPP) are two features that implement one-to-one translation of a source IP address while allowing the source port to change. Static IP translates a single source address to a specific public address, and allows the source port to change dynamically<sup>1</sup>. Dynamic IP and Port (DIPP) translates the source IP address or range to a single IP address, and uses the source port to differentiate between multiple source IPs that share the same translated address<sup>2</sup>. Both of these features provide a one-to-one translation of IP addresses, but do not restrict the source port. References:

#### NEW QUESTION # 74

An engineer at a managed services provider is updating an application that allows its customers to request firewall changes to also manage SD-WAN. The application will be able to make any approved changes directly to devices via API.

What is a requirement for the application to create SD-WAN interfaces?

- A. XML API's "sdwanprofiles/interfaces" parameter on a Panorama device
- B. REST API's "sdwanInterfaces" parameter on a firewall device
- C. XML API's "InterfaceProfiles/sdwan" parameter on a firewall device
- D. REST API's "sdwanInterfaceprofiles" parameter on a Panorama device

**Answer: B**

Explanation:

To create SD-WAN interfaces through an API, the correct approach is to use the REST API's "sdwanInterfaces" parameter on a firewall device. This parameter allows you to configure SD-WAN interfaces directly on the firewall devices via API, ensuring that the required interfaces are set up and managed for SD-WAN functionality.

#### NEW QUESTION # 75

You are a Network Security Analyst managing a Palo Alto Networks firewall. A critical internal application, 'Project-Zeus', connects to an external SaaS provider over TCP/443. This SaaS service uses a highly customized TLS implementation that consistently causes App-ID to identify the traffic as 'ssl-unknown' or 'unknown-tcp', even though the service is legitimate and approved. The security team wants to ensure 'Project-Zeus' traffic is explicitly identified as 'project-zeus-app' (a pre-defined custom application) to apply a specific set of security profiles, including advanced threat prevention and decryption, that are tailored to its known behavior. The SaaS provider's IP range is dynamic but always resides within a specific FQDN object (saas.example.com) that resolves to multiple IPs.

Which combination of configuration elements will reliably achieve this goal?

- A. 1. Configure SSL Decryption for traffic destined to 'saas.example.com'.
- B. 1. Create a Service Object for TCP/443.
- C. 1. Create an Application Filter including 'ssl-unknown' and 'unknown-tcp'.
- D. 1. Create an Application Override rule with Application: 'project-zeus-app', Protocol: 'tcp', Port: '443', Source: 'Internal-Zeus-Server-IP', Destination:
- E. 1. Create an Application Override rule with Application: 'project-zeus-app', Protocol: 'tcp', Port: '443', Source: 'Internal-Zeus-Server-IP', Destination: 'Any'.

**Answer: D**

### Explanation:

This question combines the need for Application Override with FQDN objects. An Application Override is the most robust solution for forcing application identification when App-ID struggles with proprietary protocols on standard or non-standard ports. Option A correctly uses the Application Override to classify the traffic based on source IP, port, and most importantly, the FQDN object for the dynamic destination. This ensures the correct identification before the security policy is applied, allowing granular control. While SSL Decryption (Option B) might reveal more, the problem states the issue is with App-ID's initial classification, which an override directly addresses without necessarily needing decryption for the override itself. Creating custom signatures (Option B part 2) is more complex and maintenance-heavy. Options C, D, and E either don't reclassify the traffic effectively or are too broad/less precise.
